1. iad program.

Here is a relatively robust command-line utility that shows how the iad and ad subroutines might be called. It suffers because it is written in CWEB and I used the macro expansion feature instead of creating separate functions. Oh well.

I create an empty file `iad_main.h` to simplify the Makefile

`<iad_main.h 1> ≡`

2. All the actual output for this web file goes into `iad_main.c`

`<iad_main.c 2> ≡`

```

<Include files for main 3>
<print version function 18>
<print usage function 19>
<stringdup together function 25>
<mystrtod function 26>
<seconds elapsed function 27>
<print error legend function 24>
<print dot function 29>
<calculate coefficients function 20>
<parse string into array function 28>
<print results header function 22>
<Print results function 23>
int main(int argc, char **argv)
{
    <Declare variables for main 4>
    <Handle options 5>
    Initialize_Measure(&m);
    <Command-line changes to m 16>
    Initialize_Result(m, &r);
    <Command-line changes to r 13>
    if (cl_forward_calc ≠ UNINITIALIZED) {
        <Calculate and Print the Forward Calculation 6>
        exit(EXIT_SUCCESS);
    }
    <prepare file for reading 10>
    if (process_command_line) {
        <Count command-line measurements 17>
        <Calculate and write optical properties 11>
        exit(EXIT_SUCCESS);
    }
    if (Read_Header(stdin, &m, &params) ≡ 0) {
        start_time = clock();
        while (Read_Data_Line(stdin, &m, params) ≡ 0) {
            <Command-line changes to m 16>
            <Calculate and write optical properties 11>
        }
    }
    if (cl_verbosity > 0) fprintf(stderr, "\n\n");
    if (any_error ∧ cl_verbosity > 1) print_error_legend();
    exit(EXIT_SUCCESS);
}

```

3. The first two defines are to stop Visual C++ from silly complaints

```

```

This code is used in section 2.

6. We are doing a forward calculation. We still need to set the albedo and optical depth appropriately. Obviously when the -a switch is used then the albedo should be fixed as a constant equal to *cl_default_a*. The other cases are less clear. If scattering and absorption are both specified, then calculate the albedo using these values. If the scattering is not specified, then we assume that the sample is an unscattering sample and therefore the albedo is zero. On the other hand, if the scattering is specified and the absorption is not, then the albedo is set to one.

```

⟨ Calculate and Print the Forward Calculation 6 ⟩ ≡
  if (cl_default_a ≡ UNINITIALIZED) {
    if (cl_default_mus ≡ UNINITIALIZED) r.a = 0;
    else if (cl_default_mua ≡ UNINITIALIZED) r.a = 1;
    else r.a = cl_default_mus / (cl_default_mua + cl_default_mus);
  }
  else r.a = cl_default_a;

```

See also sections 7, 8, and 9.

This code is used in section 2.

7. This is slightly more tricky because there are four things that can affect the optical thickness — *cl_default_b*, the default mua, default mus and the thickness. If the sample thickness is unspecified, then the only reasonable thing to do is to assume that the sample is very thick. Otherwise, we use the sample thickness to calculate the optical thickness.

```

⟨ Calculate and Print the Forward Calculation 6 ⟩ +≡
  if (cl_default_b ≡ UNINITIALIZED) {
    if (cl_sample_d ≡ UNINITIALIZED) r.b = HUGE_VAL;
    else if (r.a ≡ 0) {
      if (cl_default_mua ≡ UNINITIALIZED) r.b = HUGE_VAL;
      else r.b = cl_default_mua * cl_sample_d;
    }
    else {
      if (cl_default_mus ≡ UNINITIALIZED) r.b = HUGE_VAL;
      else r.b = cl_default_mus / r.a * cl_sample_d;
    }
  }
  else r.b = cl_default_b;

```

8. The easiest case, use the default value or set it to zero

```

⟨ Calculate and Print the Forward Calculation 6 ⟩ +≡
  if (cl_default_g ≡ UNINITIALIZED) r.g = 0;
  else r.g = cl_default_g;

```

9. \langle Calculate and Print the Forward Calculation 6 $\rangle + \equiv$

```

This code is used in section 2.

11. Need to explicitly reset *r.search* each time through the loop, because it will get altered by the calculation process. We want to be able to let different lines have different constraints. In particular consider the file *newton.tst*. In that file the first two rows contain three real measurements and the last two have the collimated transmission explicitly set to zero — in other words there are really only two measurements.

    if (both == 0) fprintf(stderr, "Could not allocate memory for both strings.\n");
    strcpy(both, s);
    strcat(both, t);
    return both;
}
```

This code is used in section 2.

26. catch parsing errors in strtod

⟨mystrtod function 26⟩ ≡

```
static double my_strtod(const char *str)
{
    char *endptr;
    errno = 0;
    double val = strtod(str, &endptr);
    if (endptr == str) { /* No digits were found */
        fprintf(stderr, "Error in command-line\n");
        fprintf(stderr, "No conversion could be performed for '%s'.\n", str);
        exit(EXIT_FAILURE);
    }
    if (*endptr != '\0') { /* String contains extra characters after the number */
        fprintf(stderr, "Error in command-line\n");
        fprintf(stderr, "Partial conversion of string = '%s'\n", str);
        exit(EXIT_FAILURE);
    }
    if (errno == ERANGE) {
        /* The converted value is out of range of representable values by a double */
        fprintf(stderr, "Error in command-line\n");
        printf("The value '%s' is out of range of double.\n", str);
        exit(EXIT_FAILURE);
    }
    return val;
}
```

This code is used in section 2.

27. assume that start time has already been set

⟨seconds elapsed function 27⟩ ≡

```
static double seconds_elapsed(clock_t start_time)
{
    clock_t finish_time = clock();
    return (double)(finish_time - start_time)/CLOCKS_PER_SEC;
}
```

This code is used in section 2.

28. given a string and an array, this fills the array with numbers from the string. The numbers should be separated by spaces.

Returns 0 upon successfully filling n entries, returns 1 for any error.

⟨parse string into array function 28⟩ ≡

```
static int parse_string_into_array(char *s, double *a, int n)
{
    char *t, *last, *r;
    int i = 0;

    t = s;
    last = s + strlen(s);
    while (t < last) { /* a space should mark the end of number */
        r = t;
        while (*r ≠ ' ' ∧ *r ≠ '\0') r++;
        *r = '\0'; /* parse the number and save it */
        if (sscanf(t, "%lf", &(a[i])) ≡ 0) return 1;
        i++; /* are we done ? */
        if (i ≡ n) {
            if (a[i - 1] ≤ 0 ∨ a[i - 1] > 1) {
                fprintf(stderr,
                    "Sphere wall reflectivity (r_w=%g) must be a fraction less than one.\n",
                    a[i - 1]);
                exit(EXIT_FAILURE);
            }
            return 0;
        } /* move pointer just after last number */
        t = r + 1;
    }
    return 1;
}
```

This code is used in section 2.

29. The idea here is to show some intermediate output while a file is being processed.

```

<print dot function 29> ≡
static char what_char(int err)
{
    if (err == IAD_NO_ERROR) return '*';
    if (err == IAD_TOO_MANY_ITERATIONS) return '+';
    if (err == IAD_MR_TOO_BIG) return 'R';
    if (err == IAD_MR_TOO_SMALL) return 'r';
    if (err == IAD_MT_TOO_BIG) return 'T';
    if (err == IAD_MT_TOO_SMALL) return 't';
    if (err == IAD_MU_TOO_BIG) return 'U';
    if (err == IAD_MU_TOO_SMALL) return 'u';
    if (err == IAD_TOO_MUCH_LIGHT) return '!';
    return '?';
}

static void print_dot(clock_t start_time, int err, int points, int final, int verbosity)
{
    static int counter = 0;

    counter++;
    if (verbosity == 0 ∨ Debug(DEBUG_ANY)) return;
    if (final) fprintf(stderr, "%c", what_char(err));
    else {
        counter--;
        fprintf(stderr, "%1d\b", points % 10);
    }
    if (final) {
        if (counter % 50 == 0) {
            double rate = (seconds_elapsed(start_time)/counter);
            fprintf(stderr, "\u00%3d\done\u00(%5.2f\u00s/pt)\n", counter, rate);
        }
        else if (counter % 10 == 0) fprintf(stderr, "\u00");
    }
    fflush(stderr);
}

```

This code is used in section 2.

30. Simple command-line shell program.

Here is a quick skeleton that I put together to show how the inverse adding-doubling code works. I have only cursorily tested this. If you find obvious bugs, they are probably real but should not extend beyond this code snippet.

All the output for this web file goes into `iad_main.c`

```
<iad_main_mus.c 30> ≡
<Include files for main 3>
int main(int argc, char **argv)
{
    <Declare variables for main 4>
    if (Read_Header(&m, &r) ≡ TRUE) {
        <Process the header 33>
        m.num_measures = 2;
        m.m_r = 0.0;
        m.slab_thickness = 0.1;
        while (fp ≠ EOF) {
            fp = scanf("%lf%lf%lf%lf", &lambda, &r.mu_a, &m.default_g, &m.m_t);
            fp = readln(&line);
            <Calculate and write optical properties 11>
        }
    }
    exit(EXIT_SUCCESS);
}
```

31. <Include files for main 3> +≡

```
#include <stdio.h>
#include <string.h>
#include <stdlib.h>
#include "ad_globl.h"
#include "iad_type.h"
#include "iad_pub.h"
#include "iad_io.h"
```

32. <Declare variables for main 4> +≡

```
struct measure_type m;
struct invert_type r;
int lines;
char *format1 = "R\tT\tTc\ta\tb\t\ng\t!/?\n";
char *format2 = "%9.5f\t%9.5f\t%9.5f\t%9.5f\t%9.5f\t%9.5f\t%9c\n";
char found = '?';
int fp;
double lambda;
int line = 1;
```

33. <Process the header 33> ≡

```
m.slab_thickness = 1;
Initialize_Result(m, &r);
Write_Header(m, r);
lines = 1;
printf(format1, m.m_r, m.m_t, m.m_u, r.a, r.b, r.g);
```

This code is used in section 30.

34. \langle Calculate and write optical properties 11 $\rangle + \equiv$

```
{  
  r.search = FIND_mus;  
  Inverse_RT(m, &r);  
  if (r.found  $\equiv$  TRUE) found = '!' ;  
  else found = '?';  
  printf(format2, m.m_r, m.m_t, m.m_u, r.a, r.b, r.g, found);  
  fflush(stdout);  
}
```

35. IAD Types. This file has no routines. It is responsible for creating the header file `iad_type.h` and nothing else.

```

<iad_type.h 35> ≡
#undef FALSE
#undef TRUE
  <Preprocessor definitions>
  <Structs to export from IAD Types 38>

```

  <Definition for Calculate_Minimum_MR 81>
```

42. All the information that needs to be written to the header file *iad_pub.h*. This eliminates the need to maintain a set of header files as well.

```
<iad_pub.h 42> ≡
  <Prototype for Inverse_RT 44>;
  <Prototype for measure_OK 50>;
  <Prototype for determine_search 57>;
  <Prototype for Initialize_Result 61>;
  <Prototype for ez_Inverse_RT 67>;
  <Prototype for Initialize_Measure 69>;
  <Prototype for Calculate_MR_MT 78>;
  <Prototype for MinMax_MR_MT 82>;
  <Prototype for Calculate_Minimum_MR 80>;
  <Prototype for Spheres_Inverse_RT2 84>;
```

43. Here is the header file needed to access one interesting routine in the *libiad.so* library.

```
<lib_iad.h 43> ≡
  <Prototype for ez_Inverse_RT 67>;
  <Prototype for Spheres_Inverse_RT 71>;
  <Prototype for Spheres_Inverse_RT2 84>;
```

44. Inverse RT. *Inverse_RT* is the main function in this whole package. You pass the variable *m* containing your experimentally measured values to the function *Inverse_RT*. It hopefully returns the optical properties in *r* that are appropriate for your experiment.

⟨Prototype for *Inverse_RT* 44⟩ ≡

```
void Inverse_RT(struct measure_type m, struct invert_type *r)
```

This code is used in sections 42 and 45.

45. ⟨Definition for *Inverse_RT* 45⟩ ≡

⟨Prototype for *Inverse_RT* 44⟩

```
{
  if (0 ^ Debug(DEBUG_LOST_LIGHT)) {
    fprintf(stderr, "**_Inverse_RT_(%d_spheres)_**\n", m.num_spheres);
    fprintf(stderr, "M_R=%%8.5f, MT=%%8.5f\n", m.m_r, m.m_t);
    fprintf(stderr, "UR1_lost=%%8.5f, UT1_lost=%%8.5f\n", m.ur1_lost, m.ut1_lost);
  }
  r→found = FALSE;
  if (r→search == FIND_AUTO) r→search = determine_search(m, *r);
  if (r→search == FIND_B_WITH_NO_ABSORPTION) {
    r→default_a = 1;
    r→search = FIND_B;
  }
  if (r→search == FIND_B_WITH_NO_SCATTERING) {
    r→default_a = 0;
    r→search = FIND_B;
  }
  ⟨Exit with bad input data 46⟩
  ⟨Find the optical properties 47⟩
  ⟨Print basic sphere and MC effects 48⟩
  if (r→final_distance ≤ r→tolerance) r→found = TRUE;
}
```

This code is used in section 41.

46. There is no sense going to all the trouble to try a multivariable minimization if the input data is bogus. So I wrote a single routine *measure_OK* to do just this.

⟨Exit with bad input data 46⟩ ≡

```
r→error = measure_OK(m, *r);
if (r→method.quad_pts < 4) r→error = IAD_QUAD_PTS_NOT_VALID;
if (r→error ≠ IAD_NO_ERROR) return;
```

This code is used in section 45.

47. Now I fob the real work off to the unconstrained minimization routines. Ultimately, I would like to replace all these by constrained minimization routines. Actually the first five already are constrained. The real work will be improving the last five because these are 2-D minimization routines.

⟨Find the optical properties 47⟩ ≡

```

switch (r-search) {

}

```

This code is used in section 45.

49. Validation.

50. Now the question is — just what is bad data? Here's the prototype.

⟨Prototype for *measure_OK* 50⟩ ≡

```
int measure_OK(struct measure_type m, struct invert_type r)
```

This code is used in sections 42 and 51.

51. It would just be nice to stop computing with bad data. This does not work in practice because it turns out that there is often bogus data in a full wavelength scan. Often the reflectance is too low for short wavelengths and at long wavelengths the detector (photomultiplier tube) does not work worth a damn.

The two sphere checks are more complicated. For example, we can no longer categorically state that the transmittance is less than one or that the sum of the reflectance and transmittance is less than one. Instead we use the transmittance to bound the values for the reflectance — see the routine *MinMax_MR_MT* below.

⟨Definition for *measure_OK* 51⟩ ≡

⟨Prototype for *measure_OK* 50⟩

```
{
  double ru, tu;
  if (m.num_spheres ≠ 2) {
    ⟨Check MT for zero or one spheres 53⟩
    ⟨Check MR for zero or one spheres 52⟩
  }
  else {
    int error = MinMax_MR_MT(m, r);
    if (error ≠ IAD_NO_ERROR) return error;
  }
  ⟨Check MU 54⟩
  if (m.num_spheres ≠ 0) {
    ⟨Check sphere parameters 55⟩
  }
  return IAD_NO_ERROR;
}
```

This code is used in section 41.

52. The reflectance is constrained by the index of refraction of the material and the transmission. The upper bound for the reflectance is just one minus the transmittance. The specular (unscattered) reflectance from the boundaries imposes minimum for the reflectance. Obviously, the reflected light cannot be less than that from the first boundary. This might be calculated by assuming an infinite layer thickness. But we can do better.

There is a definite bound on the minimum reflectance from a sample. If you have a sample with a given transmittance m_t , the minimum reflectance possible is found by assuming that the sample does not scatter any light.

Knowledge of the indices of refraction makes it a relatively simple matter to determine the optical thickness $b = \mu_a * d$ of the slab. The minimum reflection is obtained by including all the specular reflectances from all the surfaces.

If the default albedo has been specified as zero, then there is really no need to check MR because it is ignored.

⟨ Check MR for zero or one spheres 52 ⟩ ≡

```
{
  double mr, mt;
  Calculate_Minimum_MR(m, r, &mr, &mt);
  /* one parameter search only needs one good measurement */
  if (r.search ≡ FIND_A ∨ r.search ≡ FIND_G ∨ r.search ≡ FIND_B ∨ r.search ≡ FIND_Bs ∨ r.search ≡
      FIND_Ba) {
    if (m.m_r < mr ∧ m.m_t ≤ 0) return IAD_MR_TOO_SMALL;
  }
  else {
    if (r.default_a ≡ UNINITIALIZED ∨ r.default_a > 0) {
      if (m.m_r < mr) return IAD_MR_TOO_SMALL;
    }
  }
}
```

This code is used in section 51.

53. The transmittance is also constrained by the index of refraction of the material. The minimum transmittance is zero, but the maximum transmittance cannot exceed the total light passing through the sample when there is no scattering or absorption. This is calculated by assuming an infinitely thin (to eliminate any scattering or absorption effects).

There is a problem when spheres are present. The estimated values for the transmittance using Sp_mu_RT are not actually limiting cases. This will require a bit of fixing, but for now that test is omitted if the number of spheres is more than zero.

⟨ Check MT for zero or one spheres 53 ⟩ ≡

```
if (m.m_t < 0) return IAD_MT_TOO_SMALL;
Sp_mu_RT_Flip(m.flip_sample, r.slab.n_top_slide, r.slab.n_slab, r.slab.n_bottom_slide, r.slab.b_top_slide, 0,
  r.slab.b_bottom_slide, r.slab.cos_angle, &ru, &tu);
if (m.num_spheres ≡ 0 ∧ m.m_t > tu) {
  fprintf(stderr, "ntop=%7.5f, nslab=%7.5f, nbottom=%7.5f\n", r.slab.n_top_slide, r.slab.n_slab,
    r.slab.n_bottom_slide);
  fprintf(stderr, "tu_max=%7.5f, m_t=%7.5f, t_std=%7.5f\n", tu, m.m_t, m.rstd_t);
  return IAD_MT_TOO_BIG;
}
```

This code is used in section 51.

54. The unscattered transmission is now always included in the total transmittance. Therefore the unscattered transmittance must fall between zero and M_T

⟨ Check MU 54 ⟩ \equiv

```

    if ( $m.m_u < 0$ ) return IAD_MU_TOO_SMALL;
    if ( $m.m_t > 0 \wedge m.m_u > m.m_t$ ) return IAD_MU_TOO_BIG;

```

This code is used in section 51.

55. Make sure that reflection sphere parameters are reasonable

⟨ Check sphere parameters 55 ⟩ \equiv

```

    if ( $m.as_r < 0 \vee m.as_r \geq 0.2$ ) return IAD_AS_NOT_VALID;
    if ( $m.ad_r < 0 \vee m.ad_r \geq 0.2$ ) return IAD_AD_NOT_VALID;

    if ( $m.f_t < 0 \vee m.f_t > 1$ ) return IAD_F_NOT_VALID;

```

57. Searching Method.

The original idea was that this routine would automatically determine what optical parameters could be figured out from the input data. This worked fine for a long while, but I discovered that often it was convenient to constrain the optical properties in various ways. Consequently, this routine got more and more complicated.

What should be done is to figure out whether the search will be 1D or 2D and split this routine into two parts.

It would be nice to enable the user to constrain two parameters, but the infrastructure is missing at this point.

⟨Prototype for *determine_search* 57⟩ ≡

search_type *determine_search*(**struct measure_type** *m*, **struct invert_type** *r*)

This code is used in sections 42 and 58.

58. This routine is responsible for selecting the appropriate optical properties to determine.

⟨Definition for *determine_search* 58⟩ ≡

⟨Prototype for *determine_search* 57⟩

```
{

    if (search == FIND_B_WITH_NO_SCATTERING)
        fprintf(stderr, "search=FIND_B_WITH_NO_SCATTERING\n");
}
return search;
}

```

This code is used in section 41.

59. The fastest inverse problems are those in which just one measurement is known. This corresponds to a simple one-dimensional minimization problem. The only complexity is deciding exactly what should be allowed to vary. The basic assumption is that the anisotropy has been specified or will be assumed to be zero.

If the anisotropy is assumed known, then one other assumption will allow us to figure out the last parameter to solve for.

Ultimately, if no default values are given, then we look at the value of the total transmittance. If this is zero, then we assume that the optical thickness is infinite and solve for the albedo. Otherwise we will just make a stab at solving for the optical thickness assuming the albedo is one.

⟨ One parameter search 59 ⟩ ≡

```

    if (r.default_a != UNINITIALIZED) {
        if (r.default_a == 0) search = FIND_B_WITH_NO_SCATTERING;
        else if (r.default_a == 1) search = FIND_B_WITH_NO_ABSORPTION;
        else if (tt == 0) search = FIND_G;
        else search = FIND_B;
    }
    else if (r.default_b != UNINITIALIZED) search = FIND_A;
    else if (r.default_bs != UNINITIALIZED) search = FIND_Ba;
    else if (r.default_ba != UNINITIALIZED) search = FIND_Bs;
    else if (td == 0) search = FIND_A;
    else if (rd == 0) search = FIND_B_WITH_NO_SCATTERING;
    else search = FIND_B_WITH_NO_ABSORPTION;

```

This code is used in section 58.

60. If the absorption depth $\mu_a d$ is constrained return *FIND_BsG*. Recall that I use the bizarre mnemonic $bs = \mu_s d$ here and so this means that the program will search over various values of $\mu_s d$ and g .

If there are just two measurements then I assume that the anisotropy is not of interest and the only thing to calculate is the reduced albedo and optical thickness based on an assumed anisotropy.

```

⟨Two parameter search 60⟩ ≡
  if (r.default_a ≠ UNINITIALIZED) {
    if (r.default_a ≡ 0) search = FIND_B;
    else if (r.default_g ≠ UNINITIALIZED) search = FIND_B;
    else search = FIND_BG;
  }
  else if (r.default_b ≠ UNINITIALIZED) {
    if (r.default_g ≠ UNINITIALIZED) search = FIND_A;
    else search = FIND_AG;
  }
  else if (r.default_ba ≠ UNINITIALIZED) {
    if (r.default_g ≠ UNINITIALIZED) search = FIND_Bs;
    else search = FIND_BsG;
  }
  else if (r.default_bs ≠ UNINITIALIZED) {
    if (r.default_g ≠ UNINITIALIZED) search = FIND_Ba;
    else search = FIND_BaG;
  }
  else if (rt + tt > 1 ∧ 0 ∧ m.num_spheres ≠ 2) search = FIND_B_WITH_NO_ABSORPTION;
  else search = FIND_AB;

```

This code is used in section 58.

61. This little routine just stuffs reasonable values into the structure we use to return the solution. This does not replace the values for *r.default_g* nor for *r.method.quad_pts*. Presumably these have been set correctly elsewhere.

```

⟨Prototype for Initialize_Result 61⟩ ≡

  r→method.quad_pts = 8;
  r→method.b_thinnest = 1.0/32.0;

```

67. EZ Inverse RT. *ez_Inverse_RT* is a simple interface to the main function *Inverse_RT* in this package. It eliminates the need for complicated data structures so that the command line interface (as well as those to Perl and Mathematica) will be simpler. This function assumes that the reflection and transmission include specular reflection and that the transmission also include unscattered transmission.

Other assumptions are that the top and bottom slides have the same index of refraction, that the illumination is collimated. Of course no sphere parameters are included.

⟨Prototype for *ez_Inverse_RT* 67⟩ ≡

    if (r.default_g  $\equiv$  UNINITIALIZED) r.slab.g = 0.0;
    else r.slab.g = r.default_g;
    r.a = r.slab.a;
    r.b = r.slab.b;
    r.g = r.slab.g;
    Calculate_MR_MT(m, r, FALSE, TRUE, mr, mt);
    *mt = 0;
}

```

This code is used in section 41.

82. The minimum possible value of MR for a given MT will be when the albedo is zero and the maximum value will be when the albedo is one. In the first case there will be no light loss and in the second we will assume that any light loss is negligible (to maximize MR).

The second case is perhaps over-simplified. Obviously for a fixed thickness as the albedo increases, the reflectance will increase. So how does *U_Find_B()* work when the albedo is set to 1?

The problem is that to calculate these values one must know the optical thickness. Fortunately with the recent addition of constrained minimization, we can do exactly this.

The only thing that remains is to sort out the light lost effect.

⟨Prototype for *MinMax_MR_MT* 82⟩ ≡

117. Initialization.

The functions in this file assume that the local variables **MM** and **RR** have been initialized appropriately. The variable **MM** contains all the information about how a particular experiment was done. The structure **RR** contains the data structure that is passed to the adding-doubling routines as well as the number of quadrature points.

118. Gain.

Assume that a sphere is illuminated with diffuse light having a power P . This light will undergo multiple reflections in the sphere walls that will increase the power falling on the detector.

The gain on the detector due to integrating sphere effects varies with the presence of a baffle between the sample and the detector. If a baffle is present then

$$G_{\text{no baffle}}(r_s) = \frac{1}{1 - a_w r_w - a_d r_d - a_s r_s}$$

or with a baffle as

$$G_{\text{baffle}}(r_s) = \frac{1}{1 - a_w r_w - r_w(1 - a_e)(a_d r_d + a_s r_s)}$$

For a black sphere the gain does not depend on the diffuse reflectivity of the sample and is unity. $G(r_s) = 1$, which is easily verified by setting $r_w = 0$.

119. $\langle \text{Prototype for Gain 119} \rangle \equiv$

double Gain(int sphere, struct measure_type m, double URU)

This code is used in sections 116 and 120.

120. $\langle \text{Definition for Gain 120} \rangle \equiv$

$\langle \text{Prototype for Gain 119} \rangle$

```
{
  double G, denom;
  if (sphere == REFLECTION_SPHERE) {
    if (m.baffle_r) denom = 1.0 - m.rw_r * (m.aw_r + (1 - m.ae_r) * (m.ad_r * m.rd_r + m.as_r * URU));
    else denom = 1.0 - m.aw_r * m.rw_r - m.ad_r * m.rd_r - m.as_r * URU;
  }
  else {
    if (m.baffle_t) denom = 1.0 - m.rw_t * (m.aw_t + (1 - m.ae_t) * (m.ad_t * m.rd_t + m.as_t * URU));
    else denom = 1.0 - m.aw_t * m.rw_t - m.ad_t * m.rd_t - m.as_t * URU;
  }
  G = 1.0/denom;
  return G;
}
```

This code is used in section 115.

121. The gain for light on the detector in the first sphere for diffuse light starting in that same sphere is defined as

$$G_{1 \rightarrow 1}(r_s, t_s) \equiv \frac{P_{1 \rightarrow 1}(r_s, t_s)/A_d}{P/A}$$

then the full expression for the gain is

$$G_{1 \rightarrow 1}(r_s, t_s) = \frac{G(r_s)}{1 - a_s a'_s r_w r'_w (1 - a_e)(1 - a'_e) G(r_s) G'(r_s) t_s^2}$$

$\langle \text{Prototype for Gain 11 121} \rangle \equiv$

double Gain_11(struct measure_type m, double URU, double tdiffuse)

This code is used in sections 116 and 122.

122. $\langle \text{Definition for } \textit{Gain_11} \text{ 122} \rangle \equiv$

$\langle \text{Prototype for } \textit{Gain_11} \text{ 121} \rangle$

```
{
  double G, GP, G11;
  G = Gain(REFLECTION_SPHERE, m, URU);
  GP = Gain(TRANSMISSION_SPHERE, m, URU);
  G11 = G / (1 - m.as_r * m.as_t * m.aw_r * m.aw_t * (1 - m.ae_r) * (1 - m.ae_t) * G * GP * tdiffuse * tdiffuse);
  return G11;
}
```

This code is used in section 115.

123. Similarly, when the light starts in the second sphere, the gain for light on the detector in the second sphere $G_{2 \rightarrow 2}$ is found by switching all primed variables to unprimed. Thus $G_{2 \rightarrow 1}(r_s, t_s)$ is

$$G_{2 \rightarrow 2}(r_s, t_s) = \frac{G'(r_s)}{1 - a_s a'_s r_w r'_w (1 - a_e)(1 - a'_e) G(r_s) G'(r_s) t_s^2}$$

$\langle \text{Prototype for } \textit{Gain_22} \text{ 123} \rangle \equiv$

double *Gain_22*(**struct measure_type** m, **double** URU, **double** tdiffuse)

This code is used in sections 116 and 124.

124. $\langle \text{Definition for } \textit{Gain_22} \text{ 124} \rangle \equiv$

$\langle \text{Prototype for } \textit{Gain_22} \text{ 123} \rangle$

```
{
  double G, GP, G22;
  G = Gain(REFLECTION_SPHERE, m, URU);
  GP = Gain(TRANSMISSION_SPHERE, m, URU);
  G22 = GP / (1 - m.as_r * m.as_t * m.aw_r * m.aw_t * (1 - m.ae_r) * (1 - m.ae_t) * G * GP * tdiffuse * tdiffuse);
  return G22;
}
```

This code is used in section 115.

125. The reflected power for two spheres makes use of the formulas for *Gain_11* above.

The light on the detector in the reflection (first) sphere arises from three sources: the fraction of light directly reflected off the sphere wall $f r_w^2 (1 - a_e) P$, the fraction of light reflected by the sample $(1 - f) r_s^{\text{direct}} r_w^2 (1 - a_e) P$, and the light transmitted through the sample $(1 - f) t_s^{\text{direct}} r'_w (1 - a'_e) P$,

$$\begin{aligned} R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= G_{1 \rightarrow 1}(r_s, t_s) \cdot a_d (1 - a_e) r_w^2 f P \\ &\quad + G_{1 \rightarrow 1}(r_s, t_s) \cdot a_d (1 - a_e) r_w (1 - f) r_s^{\text{direct}} P \\ &\quad + G_{2 \rightarrow 1}(r_s, t_s) \cdot a_d (1 - a'_e) r'_w (1 - f) t_s^{\text{direct}} P \end{aligned}$$

which simplifies slightly to

$$\begin{aligned} R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= a_d (1 - a_e) r_w P \cdot G_{1 \rightarrow 1}(r_s, t_s) \\ &\quad \times \left[(1 - f) r_s^{\text{direct}} + f r_w + (1 - f) a'_s (1 - a'_e) r'_w t_s^{\text{direct}} t_s G'(r_s) \right] \end{aligned}$$

$\langle \text{Prototype for } \textit{Two_Sphere_R} \text{ 125} \rangle \equiv$

double *Two_Sphere_R*(**struct measure_type** m, **double** UR1, **double** URU, **double** UT1, **double** UTU)

This code is used in sections 116 and 126.

126. $\langle \text{Definition for } Two_Sphere_R \text{ 126} \rangle \equiv$
 $\langle \text{Prototype for } Two_Sphere_R \text{ 125} \rangle$

```
{
  double x, GP;
  GP = Gain(TRANSMISSION_SPHERE, m, URU);
  x = m.ad_r * (1 - m.ae_r) * m.rw_r * Gain_11(m, URU, UTU);
  x *= (1 - m.f_r) * UR1 + m.rw_r * m.f_r + (1 - m.f_r) * m.as_t * (1 - m.ae_t) * m.rw_t * UT1 * UTU * GP;
  return x;
}
```

This code is used in section 115.

127. For the power on the detector in the transmission (second) sphere we have the same three sources. The only difference is that the subscripts on the gain terms now indicate that the light ends up in the second sphere

$$\begin{aligned} T(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= G_{1 \rightarrow 2}(r_s, t_s) \cdot a'_d(1 - a_e)r_w^2 f P \\ &\quad + G_{1 \rightarrow 2}(r_s, t_s) \cdot a'_d(1 - a_e)r_w(1 - f)r_s^{\text{direct}} P \\ &\quad + G_{2 \rightarrow 2}(r_s, t_s) \cdot a'_d(1 - a'_e)r'_w(1 - f)t_s^{\text{direct}} P \end{aligned}$$

or

}
```

This code is used in section 115.

129. Grid Routines. There is a long story associated with these routines. I spent a lot of time trying to find an empirical function to allow a guess at a starting value for the inversion routine. Basically nothing worked very well. There were too many special cases and what not. So I decided to calculate a whole bunch of reflection and transmission values and keep their associated optical properties linked nearby.

I did the very simplest thing. I just allocate a matrix that is five columns wide. Then I fill every row with a calculated set of optical properties and observables. The distribution of values that I use could certainly use some work, but they currently work.

SO... how does this thing work anyway? There are two possible grids one for calculations requiring the program to find the albedo and the optical depth (a and b) and one to find the albedo and anisotropy (a and g). These grids must be allocated and initialized before use.

130. This is a pretty important routine that should have some explanation. The reason that it exists, is that we need some ‘out-of-band’ information during the minimization process. Since the light transport calculation depends on all sorts of stuff (e.g., the sphere parameters) and the minimization routines just vary one or two parameters this information needs to be put somewhere.

I chose the global variables MM and RR to save things in.

The bottom line is that you cannot do a light transport calculation without calling this routine first.

  }
}

```

This code is used in section 115.

140. This routine is used to figure out if the current grid is valid. This can fail for several reasons. First the grid may not have been allocated. Or it may not have been initialized. The boundary conditions may have changed. The number or values of the sphere parameters may have changed. It is tedious, but straightforward to check these cases out.

If this routine returns true, then it is a pretty good bet that the values in the current grid can be used to guess the next starting set of values.

            }
        }
    }
    Set_Calc_State(old_mm, old_rr);
}

```

This code is used in section 115.

150. Routine to incorporate flipping of sample if needed. This is pretty simple. The assumption is that flipping is handled relative to the reflection side of the sphere. Thus even when flipping is needed, the usual call to `RT()` will result in the correct values for the reflectances. The transmission values can then be calculated by swapping the top and bottom slides.

Technically, the value of `slab` should be `const` but it is not so that we don't pay a copying overhead whenever `flip` is false (the usual case).

\langle Prototype for *RT_Flip* 150 $\rangle \equiv$

```

void RT_Flip(int flip, int n, struct AD_slab_type *slab, double *UR1, double *UT1, double
             *URU, double *UTU)

```

This code is used in sections 116 and 151.

151. \langle Definition for *RT_Flip* 151 $\rangle \equiv$

\langle Prototype for *RT_Flip* 150 \rangle

```
{
  double correct_UR1, correct_URU;
  RT(n, slab, UR1, UT1, URU, UTU);
  if (flip) {
    correct_UR1 = *UR1;
    correct_URU = *URU;
    SWAP(slab-n_top_slide, slab-n_bottom_slide)SWAP(slab-b_top_slide, slab-b_bottom_slide)RT(n, slab, UR1,
      UT1, URU, UTU);
    SWAP(slab-n_top_slide, slab-n_bottom_slide)SWAP(slab-b_top_slide,
      slab-b_bottom_slide) * UR1 = correct_UR1;
    *URU = correct_URU;
  }
}
```

This code is used in section 115.

152. Simple routine to put values into the grid

Presumes that *RR.slab* is properly set up.

\langle Definition for *fill_grid_entry* 152 $\rangle \equiv$

```
static void fill_grid_entry(int i, int j)
{
  double ur1, ut1, uru, utu;
  if (RR.slab.b  $\leq 1 \cdot 10^{-6}$ ) RR.slab.b =  $1 \cdot 10^{-6}$ ;
  if (Debug(DEBUG_EVERY_CALC)) {
    if ( $\neg$ CALCULATING_GRID)
      fprintf(stderr, "a=%8.5f b=%10.5f g=%8.5f", RR.slab.a, RR.slab.b, RR.slab.g);
    else {
      if (j  $\equiv 0$ ) fprintf(stderr, ".");
      if (i + 1  $\equiv$  GRID_SIZE  $\wedge$  j  $\equiv 0$ ) fprintf(stderr, "\n");
    }
  }
  RT_Flip(MM.flip_sample, RR.method.quad_pts, &RR.slab, &ur1, &ut1, &uru, &utu);
  if (Debug(DEBUG_EVERY_CALC)  $\wedge$   $\neg$ CALCULATING_GRID)
    fprintf(stderr, "ur1=%8.5f ut1=%8.5f\n", ur1, ut1);
  The_Grid[GRID_SIZE * i + j][A_COLUMN] = RR.slab.a;
  The_Grid[GRID_SIZE * i + j][B_COLUMN] = RR.slab.b;

    fprintf(stderr, "%10.5f %10.5f %10.5f |", RR.slab.a, RR.slab.b, RR.slab.g);
    fprintf(stderr, "%10.5f %10.5f |", MM.m_r, uru);
    fprintf(stderr, "%10.5f %10.5f \n", MM.m_t, utu);
  }
}
```

This code is used in section 115.

153. This routine fills the grid with a proper set of values. With a little work, this routine could be made much faster by (1) only generating the phase function matrix once, (2) Making only one pass through the array for each albedo value, i.e., using the matrix left over from $b = 1$ to generate the solution for $b = 2$. Unfortunately this would require a complete revision of the *Calculate_Distance* routine. Fortunately, this routine should only need to be calculated once at the beginning of each run.

⟨Prototype for *Fill_AB_Grid* 153⟩ ≡

void *Fill_AB_Grid*(**struct** *measure_type* *m*, **struct** *invert_type* *r*)

This code is used in sections 115 and 154.

154. ⟨Definition for *Fill_AB_Grid* 154⟩ ≡

⟨Prototype for *Fill_AB_Grid* 153⟩

```
{
    int i, j;
    double a;
    double min_b = -8;    /* exp(-10) is smallest thickness */
    double max_b = +8;    /* exp(+8) is greatest thickness */
    if (Debug(DEBUG_GRID)) fprintf(stderr, "Filling AB_grid\n");
    if (The_Grid ≡ Λ) Allocate_Grid(r.search);
    ⟨Zero GG 159⟩
    Set_Calc_State(m, r);
    GG_g = RR.slab.g;
    for (i = 0; i < GRID_SIZE; i++) {
        double x = (double) i / (GRID_SIZE - 1.0);
        RR.slab.b = exp(min_b + (max_b - min_b) * x);
        for (j = 0; j < GRID_SIZE; j++) {
            ⟨Generate next albedo using j 156⟩
            fill_grid_entry(i, j);
        }
    }
    The_Grid_Initialized = TRUE;
    The_Grid_Search = FIND_AB;
}
```

This code is used in section 115.

155. Now it seems that I must be a bit more subtle in choosing the range of albedos to use in the grid. Originally I just spaced them according to

$$a = 1 - \left[\frac{j-1}{n-1} \right]^3$$

where $1 \leq j \leq n$. Long ago it seems that I based things only on the square of the bracketed term, but I seem to remember that I was forced to change it from a square to a cube to get more global convergence.

So why am I rewriting this? Well, because it works very poorly for samples with small albedos. For example, when $n = 11$ then the values chosen for a are (1, .999, .992, .973, .936, .875, .784, .657, .488, .271, 0). Clearly very skewed towards high albedos.

I am considering a two part division. I'm not too sure how it should go. Let the first half be uniformly divided and the last half follow the cubic scheme given above. The list of values should then be (1, .996, .968, .892, 0.744, .5, .4, .3, .2, .1, 0).

Maybe it would be best if I just went back to a quadratic term. Who knows?

In the **if** statement below, note that it could read $j \geq k$ and still generate the same results.

```
<Nonworking code 155> ≡
  k = floor((GRID_SIZE - 1)/2);
  if (j > k) {
    a = 0.5 * (1 - (j - k - 1)/(GRID_SIZE - k - 1));
    RR.slab.a = a;
  }
  else {
    a = (j - 1.0)/(GRID_SIZE - k - 1);
    RR.slab.a = 1.0 - a * a * a/2;
  }
```

156. Here is heuristic that seems to work well

```
<Generate next albedo using j 156> ≡
  a = (double) j/(GRID_SIZE - 1.0);
  RR.slab.a = (1.0 - a * a) * (1.0 - a) + (1.0 - a) * (1.0 - a) * a;
```

This code is used in sections 154 and 158.

157. This is quite similar to *Fill_AB_Grid*, with the exception of the little shuffle I do at the beginning to figure out the optical thickness to use. The problem is that the optical thickness may not be known. If it is known then the only way that we could have gotten here is if the user dictated **FIND_AG** and specified b and only provided two measurements. Otherwise, the user must have made three measurements and the optical depth can be figured out from $m.m.u.$

This routine could also be improved by not recalculating the anisotropy matrix for every point. But this would only end up being a minor performance enhancement if it were fixed.

```
<Prototype for Fill_AG_Grid 157> ≡
  void Fill_AG_Grid(struct measure_type m, struct invert_type r)
```

This code is used in sections 115 and 158.

158. \langle Definition for *Fill_AG_Grid* 158 $\rangle \equiv$

```

This code is used in section 115.

172. This is the routine that actually finds the distance. I have factored this part out so that it can be used in the *Near_Grid_Points* routine.

Rc and *Tc* refer to the unscattered (collimated) reflection and transmission.

The only tricky part is to remember that the we are trying to match the measured values. The measured values are affected by sphere parameters and light loss. Since the values *UR1* and *UT1* are for an infinite slab sample with no light loss, the light loss out the edges must be subtracted. It is these values that are used with the sphere formulas to convert the modified *UR1* and *UT1* to values for **M_R* and **M_T*.

⟨Prototype for *Calculate_Distance_With_Corrections* 172⟩ ≡

```

    ⟨Print diagnostics 183⟩
}
```

This code is used in section 115.

174. If no spheres were used in the measurement, then presumably the measured values are the reflection and transmission. Consequently, we just ascertain what the irradiance was and whether the specular reflection ports were blocked and proceed accordingly. Note that blocking the ports does not have much meaning unless the light is collimated, and therefore the reflection and transmission is only modified for collimated irradiance.

```

⟨ Calc M_R and M_T for no spheres 174 ⟩ ≡
{
    *M_R = R_direct;
    *M_T = T_direct;
}

```

This code is used in section 173.

175. Define a bunch of temporary variable names

```

⟨ Calc M_R and M_T for single beam sphere 175 ⟩ ≡
double P_std, P, P_0, G, G_0, G_std;
int tmp;

```

See also sections 176 and 177.

This code is used in section 173.

176. In a reflection experiment, some fraction f of the incident light P_i might hit the wall first. Thus the incident power on the sample is $(1 - f)P_i$ and the incident power on the sphere wall will be fP_i . The diffuse reflection entering the sphere depends on the presence of a baffle.

If a baffle is present then

$$P_d = [a_d(1 - a_e)r_w P_i](r_s^{\text{direct}} * (1 - f) + r_w f)G(r_s)$$

and when there is no baffle

$$P_d = [a_d P_i](r_s^{\text{direct}} * (1 - f) + r_w f)G(r_s)$$

Since the quantities in square brackets are identical for $R(r_s^{\text{direct}}, r_s)$, $R(0, 0)$, and $R(r_{\text{std}}, r_{\text{std}})$ and they all cancel out when calculating the normalized reflection measurement

$$M_R = r_{\text{std}} \cdot \frac{R(r_s^{\text{direct}}, r_s) - R(0, 0)}{R(r_{\text{std}}, r_{\text{std}}) - R(0, 0)}$$

This leads to the following code for M_R

```

⟨ Calc M_R and M_T for single beam sphere 175 ⟩ +=
G_0 = Gain(REFLECTION_SPHERE, MM, 0.0);
G = Gain(REFLECTION_SPHERE, MM, R_diffuse);
G_std = Gain(REFLECTION_SPHERE, MM, MM.rstd_r);
P = G * (R_direct * (1 - MM.f_r) + MM.f_r * MM.rw_r);
P_std = G_std * (MM.rstd_r * (1 - MM.f_r) + MM.f_r * MM.rw_r);
P_0 = G_0 * (MM.f_r * MM.rw_r);
*M_R = MM.rstd_r * (P - P_0) / (P_std - P_0);

```

177. In a transmission experiment, the calculations are simpler and harder. First, the value of $T(0,0) = 0$ because computationally, there is no dark noise in the detector nor any possible light leakage from the outside into the sphere. This simplifies

$$M_T = r_0 \cdot \frac{T(t_s^{\text{direct}}, r_s) - T(0,0)}{T(t_{\text{std}}, r_{\text{std}}) - T(0,0)}$$

to

$$M_T = r_0 \cdot \frac{T(t_s^{\text{direct}}, r_s)}{T(t_{\text{std}}, r_{\text{std}})}$$

where r_0 might be r_{std} or r_w for the transmission sphere.

We do not need to worry about some fraction of the incident light P_i hitting the sphere wall before interacting with the sample.

Finally, if the transmission sphere has a baffle present for the sample measurement, then it is no longer in the right place and diffuse light entering the sphere is just $[a_d P_i] r_0$

When a baffle is present then the light falling on the detector in a transmission experiment is

$$P_d = T(t_s^{\text{direct}}, r_s) = [a_d P_i](1 - a_e) r_w t_s^{\text{direct}} G(r_s)$$

and with no baffle present

$$P_d = T(t_s^{\text{direct}}, r_s) = [a_d P_i] t_s^{\text{direct}} G(r_s)$$

The normalization $T(t_{\text{std}}, r_{\text{std}})$ can be measured in two ways.

When transmission measurements are made, typically the empty port (the one that let the light into the sphere for the reflection measurement) is filled with a white port cover whose reflectance matches the rest of the sphere. In this case, the natural way to make the standard transmission measurement is to shine the beam through the empty sample port onto the back side of the sphere. If the baffle was properly placed for the transmission experiment (between the sample port and the detector) then the calibration transmission measurement is now made in a sphere without a baffle. In addition, the beam is diffused only after bouncing off the sphere wall. Therefore the power falling on the detector is

$$P_{\text{std}} = T(1.0, r_w) = [a_d P_i] r_w G(0)$$

An alternate experiment is when there is an empty port in the sphere (perhaps to allow the unscattered light to leave). In any case, the calibration measurement is done by removing the sample and placing the calibration standare in what used to be the empty port. In this case, the roles of the sample and empty ports have switched. Consequently, the areas of the sample and empty ports must be swapped before the gain is calculated.

$$P_{\text{std}} = T(1.0, r_{\text{std}}) = [a_d P_i] r_{\text{std}} G(r_{\text{std}})$$

Note that r_w or r_{std} in P_{std} term cancel with r_0 when calculating M_T . Further, the quantities $a_d P_i$ also cancel.

```

< Calc M_R and M_T for single beam sphere 175 > +=
P = T_direct * Gain(TRANSMISSION_SPHERE, MM, R_diffuse);
if (MM.baffle_t) P *= (1 - MM.ae_t) * MM.rw_t;
tmp = MM.baffle_t;
MM.baffle_t = FALSE;
if (MM.ae_t == 0) {
    P_std = Gain(TRANSMISSION_SPHERE, MM, 0);
}
else {
    SWAP(MM.ae_t, MM.as_t);
    P_std = Gain(TRANSMISSION_SPHERE, MM, MM.rstd_t);
    SWAP(MM.ae_t, MM.as_t);
}
MM.baffle_t = tmp;
*M_T = P/P_std;

```

178. The dual beam case is different because the sphere efficiency is equivalent for measurement of light hitting the sample first or hitting the reference standard first. The dual beam measurement should report the ratio of these two reflectance measurements, thereby eliminating the need to calculate the gain completely. The same holds when no sample is present.

The normalized reflectance measurement (the difference between dual beam measurement for a port with the sample and with nothing) is

$$M_R = r_{\text{std}} \cdot \frac{(1-f)r_s^{\text{direct}} + fr_w}{(1-f')r_{\text{std}} - f'r_w} - r_{\text{std}} \cdot \frac{(1-f)(0) + fr_w}{(1-f')r_{\text{std}} - f'r_w}$$

or

$$M_R = \frac{(1-f)r_s^{\text{direct}}}{(1-f') - f'r_w/r_{\text{std}}}$$

When $f = f' = 1$, then $M_R = 1$ no matter what the reflectance is. (Leave it in this form to avoid division by zero when $f = 1$.)

The normalized transmittance is simply t_s^{direct} .

When $f = 0$ then this result is essentially the same as the no spheres result (because no sphere corrections are needed). However if the number of spheres is zero, then no lost light calculations are made and therefore that is a potential error.

⟨ Calc M_R and M_T for dual beam sphere 178 ⟩ ≡

```
{
  *M_R = (1 - MM.f_r) * R_direct / ((1 - MM.f_r) + MM.f_r * MM.rw_r / MM.rstd_r);
  *M_T = T_direct;
}
```

This code is used in section 173.

179. When two integrating spheres are present then the double integrating sphere formulas are slightly more complicated.

The normalized sphere measurements for two spheres are

$$M_R = \frac{R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) - R(0, 0, 0, 0)}{R(r_{\text{std}}, r_{\text{std}}, 0, 0) - R(0, 0, 0, 0)}$$

and

$$M_T = \frac{T(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) - T(0, 0, 0, 0)}{T(0, 0, 1, 1) - T(0, 0, 0, 0)}$$

Note that R_0 and T_0 will be zero unless one has explicitly set the fraction $m.f_r$ or $m.f_t$ to be non-zero.

⟨ Calc M_R and M_T for two spheres 179 ⟩ ≡

```
{
  double R_0, T_0;
  R_0 = TwoSphere_R(MM, 0, 0, 0, 0);
  T_0 = TwoSphere_T(MM, 0, 0, 0, 0);
  *M_R = MM.rstd_r * (TwoSphere_R(MM, R_direct, R_diffuse, T_direct,
    T_diffuse) - R_0) / (TwoSphere_R(MM, MM.rstd_r, MM.rstd_r, 0, 0) - R_0);
  *M_T = (TwoSphere_T(MM, R_direct, R_diffuse, T_direct, T_diffuse) - T_0) / (TwoSphere_T(MM, 0, 0, 1,
    1) - T_0);
}
```

This code is used in section 173.

180. There are at least three things that need to be considered here. First, the number of measurements. Second, is the metric is relative or absolute. And third, is the albedo fixed at zero which means that the transmission measurement should be used instead of the reflection measurement.

```

< Calculate the deviation 180 > ≡
  if (RR.search ≡ FIND_A ∨ RR.search ≡ FIND_G ∨ RR.search ≡ FIND_B ∨ RR.search ≡ FIND_Bs ∨ RR.search ≡
      FIND_Ba) {
    < One parameter deviation 181 >
  }
  else {
    < Two parameter deviation 182 >
  }

```

This code is used in section 173.

181. This part was slightly tricky. The crux of the problem was to decide if the transmission or the reflection was trustworthy. After looking a bunches of measurements, I decided that the transmission measurement was almost always more reliable. So when there is just a single measurement known, then use the total transmission if it exists.

```

< One parameter deviation 181 > ≡
  if (MM.m_t > 0) {
    if (RR.metric ≡ RELATIVE) *dev = fabs(MM.m_t - *M_T)/(MM.m_t + ABIT);
    else *dev = fabs(MM.m_t - *M_T);
  }
  else {
    if (RR.metric ≡ RELATIVE) *dev = fabs(MM.m_r - *M_R)/(MM.m_r + ABIT);
    else *dev = fabs(MM.m_r - *M_R);
  }

```

This code is used in section 180.

182. This stuff happens when we are doing two parameter searches. In these cases there should be information in both R and T. The distance should be calculated using the deviation from both. The albedo stuff might be able to be take out. We'll see.

```

< Two parameter deviation 182 > ≡
  if (RR.metric ≡ RELATIVE) {
    if (MM.m_t > ABIT) *dev = T_TRUST_FACTOR * fabs(MM.m_t - *M_T)/(T_diffuse + ABIT);
    if (RR.default_a ≠ 0) {
      *dev += fabs(MM.m_r - *M_R)/(R_diffuse + ABIT);
    }
  }
  else {
    *dev = T_TRUST_FACTOR * fabs(MM.m_t - *M_T);
    if (RR.default_a ≠ 0) *dev += fabs(MM.m_r - *M_R);
  }

```

This code is used in section 180.

183. This is here so that I can figure out why the program is not converging. This is a little convoluted so that the global constants at the top of this file interact properly.

```

⟨Print diagnostics 183⟩ ≡
  if ((Debug(DEBUG_ITERATIONS) ∧ ¬CALCULATING_GRID) ∨
      (Debug(DEBUG_GRID_CALC) ∧ CALCULATING_GRID)) {
    static int once;
    if (once ≠ MM.lambda) {
      fprintf(stderr, "%10s_%10s_|_%7s_%7s_|_%7s_%7s_|%8s\n", "a", "b", "g", "m_r",
          "fit", "m_t", "fit", "delta");
      once = MM.lambda;
    }
    fprintf(stderr, "%10.5f_%10.5f_| ", RR.slab.a, RR.slab.b, RR.slab.g);
    fprintf(stderr, "%7.5f_%7.5f_| ", MM.m_r, *M_R);
    fprintf(stderr, "%7.5f_%7.5f_| ", MM.m_t, *M_T);
    fprintf(stderr, "%8.5f", *dev);
    if (RR.metric ≡ RELATIVE) fprintf(stderr, "(relative)\n");

```

This code is used in sections 212, 232, 237, 243, and 248.

220. Fixed Absorption and Anisotropy. Typically, this routine is called when the absorption coefficient is known, the anisotropy is known, and the physical thickness of the sample is known. This routine calculates the varies the scattering coefficient until the measurements are matched.

This was written for Ted Moffitt to analyze some intralipid data. We wanted to know what the scattering coefficient of the Intralipid was and made total transmission measurements through a sample with a fixed physical thickness. We did not make reflection measurements because the light source diverged too much, and we could not make reflection measurements easily.

In retrospect, we could have made URU measurements by illuminating the wall of the integrating sphere. However, these diffuse type of measurements are very difficult to make accurately.

This is tricky only because the value in *slab.b* is used to hold the value of *ba* or $d \cdot \mu_a$ when the *Find_Bs_fn* is used.

⟨Prototype for *U_Find_Bs* 220⟩ ≡

    ⟨Put final values in result 218⟩
}
```

This code is used in section 209.

224. Fixed Optical Depth and Anisotropy. Typically, this routine is called when the optical thickness is assumed infinite. However, it may also be called when the optical thickness is assumed to be fixed at a particular value. Typically the only reasonable situation for this to occur is when the diffuse transmission is non-zero but the collimated transmission is zero. If this is the case then there is no information in the collimated transmission measurement and there is no sense even using it because the slab is not infinitely thick.

⟨Prototype for *U_Find_A* 224⟩ ≡

        fprintf(stderr, "(%8.5f,%8.5f,%8.5f)\n", r→a, r→b, r→g);
    }
}
```

This code is used in section 209.

230. This could be improved tremendously. I just don't want to mess with it at the moment.

⟨Iteratively solve for *b* 230⟩ ≡

```
{
    double x, ax, bx, cx, fa, fb, fc;
    ax = b2bcalc(0.1);
    bx = b2bcalc(10);
    mnbrak(&ax, &bx, &cx, &fa, &fb, &fc, Find_B_fn);
    r→final_distance = brent(ax, bx, cx, Find_B_fn, r→tolerance, &x);
    r→slab.b = bcalc2b(x);
    Set_Calc_State(m, *r);
}
```

This code is used in section 229.

231. Fixed Optical Depth.

We can get here a couple of different ways.

First there can be three real measurements, i.e., t_c is not zero, in this case we want to fix b based on the t_c measurement.

Second, we can get here if a default value for b has been set.

Otherwise, we really should not be here. Just set $b = 1$ and calculate away.

⟨Prototype for *U_Find_AG* 231⟩ \equiv

void *U_Find_AG*(**struct** **measure_type** *m*, **struct** **invert_type** **r*)

```

254. Finding optical thickness.

This routine figures out what the optical thickness of a slab based on the index of refraction of the slab and the amount of collimated light that gets through it.

It should be pointed out right here in the front that this routine does not work for diffuse irradiance, but then the whole concept of estimating the optical depth for diffuse irradiance is bogus anyway.

In version 1.3 changed all error output to *stderr*. Version 1.4 included cases involving absorption in the boundaries.

```
#define BIG_A_VALUE 999999.0
#define SMALL_A_VALUE 0.000001
⟨Prototype for What_Is_B 254⟩ ≡
    double What_Is_B(struct AD_slab_type slab, double Tc)
```

This code is used in sections 253 and 255.

```
255. ⟨Definition for What_Is_B 255⟩ ≡
    ⟨Prototype for What_Is_B 254⟩
    {
        double r1, r2, t1, t2, mu_in_slab;
        ⟨Calculate specular reflection and transmission 256⟩
        ⟨Check for bad values of Tc 257⟩
        ⟨Solve if multiple internal reflections are not present 258⟩
        ⟨Find thickness when multiple internal reflections are present 259⟩
    }
```

This code is used in section 252.

256. The first thing to do is to find the specular reflection for light interacting with the top and bottom air-glass-sample interfaces. I make a simple check to ensure that the the indices are different before calculating the bottom reflection. Most of the time the $r1 \equiv r2$, but there are always those annoying special cases.

```
⟨Calculate specular reflection and transmission 256⟩ ≡
    Absorbing_Glass_RT(1.0, slab.n_top_slide, slab.n_slab, slab.cos_angle, slab.b_top_slide, &r1, &t1);
    mu_in_slab = Cos_Snell(1.0, slab.cos_angle, slab.n_slab);
    Absorbing_Glass_RT(slab.n_slab, slab.n_bottom_slide, 1.0, mu_in_slab, slab.b_bottom_slide, &r2, &t2);
```

This code is used in section 255.

257. Bad values for the unscattered transmission are those that are non-positive, those greater than one, and those greater than are possible in a non-absorbing medium, i.e.,

$$T_c > \frac{t_1 t_2}{1 - r_1 r_2}$$

Since this routine has no way to report errors, I just set the optical thickness to the natural values in these cases.

```
⟨Check for bad values of Tc 257⟩ ≡
    if (Tc ≤ 0) return (HUGE_VAL);
    if (Tc ≥ t1 * t2 / (1 - r1 * r2)) return (0.001);
```

This code is used in section 255.

258. If either $r1$ or $r2 \equiv 0$ then things are very simple because the sample does not sustain multiple internal reflections and the unscattered transmission is

$$T_c = t_1 t_2 \exp(-b/\nu)$$

where b is the optical thickness and ν is `slab.cos_angle`. Clearly,

$$b = -\nu \ln \left(\frac{T_c}{t_1 t_2} \right)$$

⟨Solve if multiple internal reflections are not present 258⟩ ≡

if ($r1 \equiv 0 \vee r2 \equiv 0$) **return** ($-slab.cos_angle * \log(Tc/t1/t2)$);

This code is used in section 255.

259. Well I kept putting it off, but now comes the time to solve the following equation for b

$$T_c = \frac{t_1 t_2 \exp(-b)}{1 - r_1 r_2 \exp(-2b)}$$

We note immediately that this is a quadratic equation in $x = \exp(-b)$.

$$r_1 r_2 T_c x^2 + t_1 t_2 x - T_c = 0$$

Sufficient tests have been made above to ensure that none of the coefficients are exactly zero. However, it is clear that the leading quadratic term has a much smaller coefficient than the other two. Since r_1 and r_2 are typically about four percent the product is roughly 10^{-3} . The collimated transmission can be very small and this makes things even worse. A further complication is that we need to choose the only positive root.

Now the roots of $ax^2 + bx + c = 0$ can be found using the standard quadratic formula,

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

This is very bad for small values of a . Instead I use

$$q = -\frac{1}{2} \left[b + \text{sgn}(b) \sqrt{b^2 - 4ac} \right]$$

with the two roots

$$x = \frac{q}{a} \quad \text{and} \quad x = \frac{c}{q}$$

Substituting our coefficients

$$q = -\frac{1}{2} \left[t_1 t_2 + \sqrt{t_1^2 t_2^2 + 4r_1 r_2 T_c^2} \right]$$

With some algebra, this can be shown to be

$$q = -t_1 t_2 \left[1 + \frac{r_1 r_2 T_c^2}{t_1^2 t_2^2} + \dots \right]$$

The only positive root is $x = -T_c/q$. Therefore

$$x = \frac{2T_c}{t_1 t_2 + \sqrt{t_1^2 t_2^2 + 4r_1 r_2 T_c^2}}$$

(Not very pretty, but straightforward enough.)

⟨Find thickness when multiple internal reflections are present 259⟩ ≡

```
{
  double B;
  B = t1 * t2;
  return (-slab.cos_angle * log(2 * Tc / (B + sqrt(B * B + 4 * Tc * Tc * r1 * r2))));
}
```

This code is used in section 255.

260. Estimating R and T.

In several places, it is useful to know an *estimate* for the values of the reflection and transmission of the sample based on the measurements. This routine provides such an estimate, but it currently ignores anything corrections that might be made for the integrating spheres.

Good values are only really obtainable when *num_measures* \equiv 3, otherwise we need to make pretty strong assumptions about the reflection and transmission values. If *num_measures* < 3, then we will assume that no collimated light makes it all the way through the sample. The specular reflection is then just that for a semi-infinite sample and *Tc* = 0. If *num_measures* \equiv 1, then *Td* is also set to zero.

rt total reflection
rc primary or specular reflection
rd diffuse or scattered reflection
tt total transmission
tp primary or unscattered transmission
td diffuse or scattered transmission

⟨Prototype for *Estimate_RT* 260⟩ \equiv

```
void Estimate_RT(struct measure_type m, struct invert_type r, double *rt, double *tt, double
    *rd, double *rc, double *td, double *tc)
```

This code is used in sections 253 and 261.

261. ⟨Definition for *Estimate_RT* 261⟩ \equiv

⟨Prototype for *Estimate_RT* 260⟩

```
{
    ⟨Calculate the unscattered transmission and reflection 262⟩
    ⟨Estimate the backscattered reflection 263⟩
    ⟨Estimate the scattered transmission 264⟩
}
```

This code is used in section 252.

262. If there are three measurements then the specular reflection can be calculated pretty well. If there are fewer then the unscattered transmission is assumed to be zero. This is not necessarily the case, but after all, this routine only makes estimates of the various reflection and transmission quantities.

If there are three measurements, the optical thickness of the sample is required. Of course if there are three measurements then the illumination must be collimated and we can call *What_Is_B* to find out the optical thickness. We pass this value to a routine in the **fresnel.h** unit and sit back and wait.

All the above is true if sphere corrections are not needed. Now, we just fob this off on another function.

⟨Calculate the unscattered transmission and reflection 262⟩ \equiv

```
Calculate_Minimum_MR(m, r, rc, tc);
```

This code is used in section 261.

263. Finding the diffuse reflection is now just a matter of checking whether V1% contains the specular reflection from the sample or not and then just adding or subtracting the specular reflection as appropriate.

⟨ Estimate the backscattered reflection 263 ⟩ ≡

```

if (m.fraction_of_rc_in_mr) {
    *rt = m.m_r;
    *rd = *rt - m.fraction_of_rc_in_mr * (*rc);
    if (*rd < 0) {
        *rd = 0;
        *rc = *rt;
    }
}
else {
    *rd = m.m_r;
    *rt = *rd + *rc;
}
if (Debug(DEBUG_SEARCH)) {
    fprintf(stderr, "uuuuuuuuuurt=%.5f\n", *rt);
    fprintf(stderr, "uuuuestrd=%.5f\n", *rd);
}

```

This code is used in section 261.

264. The transmission values follow in much the same way as the diffuse reflection values — just subtract the specular transmission from the total transmission.

⟨ Estimate the scattered transmission 264 ⟩ ≡

```

if (m.num_measures ≡ 1) {
    *tt = 0.0;
    *td = 0.0;
}
else if (m.fraction_of_tc_in_mt) {
    *tt = m.m_t;
    *td = *tt - *tc;
    if (*td < 0) {
        *tc = *tt;
        *td = 0;
    }
}
else {
    *td = m.m_t;
    *tt = *td + *tc;
}
if (Debug(DEBUG_SEARCH)) {
    fprintf(stderr, "uuuuuuuuuutt=%.5f\n", *tt);
    fprintf(stderr, "uuuuesttd=%.5f\n", *td);
}

```

This code is used in section 261.

265. Transforming properties. Routines to convert optical properties to calculation space and back.

266. *a2acalc* is used for the albedo transformations according to

$$a_{calc} = \frac{2a - 1}{a(1 - a)}$$

Care is taken to avoid division by zero. Why was this function chosen? Well mostly because it maps the region between $[0, 1] \rightarrow (-\infty, +\infty)$.

⟨Prototype for *a2acalc* 266⟩ ≡
double a2acalc(double a)

This code is used in sections 253 and 267.

267. ⟨Definition for *a2acalc* 267⟩ ≡
 ⟨Prototype for *a2acalc* 266⟩
 {
 if ($a \leq 0$) **return** -BIG_A_VALUE;
 if ($a \geq 1$) **return** BIG_A_VALUE;
 return $((2 * a - 1)/a/(1 - a))$;
 }

This code is used in section 252.

268. *acalc2a* is used for the albedo transformations Now when we solve

$$a_{calc} = \frac{2a - 1}{a(1 - a)}$$

we obtain the quadratic equation

$$a_{calc}a^2 + (2 - a_{calc})a - 1 = 0$$

The only root of this equation between zero and one is

$$a = \frac{-2 + a_{calc} + \sqrt{a_{calc}^2 + 4}}{2a_{calc}}$$

I suppose that I should spend the time to recast this using the more appropriate numerical solutions of the quadratic equation, but this worked and I will leave it as it is for now.

⟨Prototype for *acalc2a* 268⟩ ≡
double acalc2a(double acalc)

This code is used in sections 253 and 269.

269. ⟨Definition for *acalc2a* 269⟩ ≡
 ⟨Prototype for *acalc2a* 268⟩
 {
 if ($acalc \equiv \text{BIG_A_VALUE}$) **return** 1.0;
 else if ($acalc \equiv -\text{BIG_A_VALUE}$) **return** 0.0;
 else if ($fabs(acalc) < \text{SMALL_A_VALUE}$) **return** 0.5;
 else return $((-2 + a_{calc} + \text{sqrt}(acalc * a_{calc} + 4))/(2 * a_{calc}))$;
 }

This code is used in section 252.

270. *g2gcalc* is used for the anisotropy transformations according to

$$g_{calc} = \frac{g}{1 + |g|}$$

which maps $(-1, 1) \rightarrow (-\infty, +\infty)$.

⟨Prototype for *g2gcalc* 270⟩ ≡

double g2gcalc(double g)

This code is used in sections 253 and 271.

271. ⟨Definition for *g2gcalc* 271⟩ ≡

⟨Prototype for *g2gcalc* 270⟩

```
{
    if (g ≤ -0.99999) return (-HUGE_VAL);
    if (g ≥ 0.99999) return (HUGE_VAL);
    return (g/(1 - fabs(g)));
}
```

This code is used in section 252.

272. *gcalc2g* is used for the anisotropy transformations it is the inverse of *g2gcalc*. The relation is

$$g = \frac{g_{calc}}{1 + |g_{calc}|}$$

⟨Prototype for *gcalc2g* 272⟩ ≡

double gcalc2g(double gcalc)

This code is used in sections 253 and 273.

273. ⟨Definition for *gcalc2g* 273⟩ ≡

⟨Prototype for *gcalc2g* 272⟩

```
{
    if (gcalc ≡ -HUGE_VAL) return -0.99999;
    if (gcalc ≡ HUGE_VAL) return 0.99999;
    return (gcalc/(1 + fabs(gcalc)));
}
```

This code is used in section 252.

274. *b2bcalc* is used for the optical depth transformations it is the inverse of *bcalc2b*. The relation is

$$b_{calc} = \ln(b)$$

The only caveats are to ensure that I don't take the logarithm of something big or non-positive.

⟨Prototype for *b2bcalc* 274⟩ ≡

double b2bcalc(double b)

This code is used in sections 253 and 275.

275. $\langle \text{Definition for } b2bcalc \text{ 275} \rangle \equiv$
 $\langle \text{Prototype for } b2bcalc \text{ 274} \rangle$

```
{
    if (b  $\equiv$  HUGE_VAL) return HUGE_VAL;
    if (b  $\leq$  0) return 0.0;
    return (log(b));
}
```

This code is used in section 252.

276. *bcalc2b* is used for the anisotropy transformations it is the inverse of *b2bcalc*. The relation is

$$b = \exp(b_{calc})$$

The only tricky part is to ensure that I don't exponentiate something big and get an overflow error. In ANSI C the maximum value for x such that 10^x is in the range of representable finite floating point numbers (for doubles) is given by `DBL_MAX_10_EXP`. Thus if we want to know if

$$e^{b_{calc}} > 10^x$$

or

$$b_{calc} > x \ln(10) \approx 2.3x$$

and this is the criterion that I use.

$\langle \text{Prototype for } bcalc2b \text{ 276} \rangle \equiv$

```
double bcalc2b(double bcalc)
```

This code is used in sections 253 and 277.

277. $\langle \text{Definition for } bcalc2b \text{ 277} \rangle \equiv$
 $\langle \text{Prototype for } bcalc2b \text{ 276} \rangle$

```
{
    if (bcalc  $\equiv$  HUGE_VAL) return HUGE_VAL;
    if (bcalc > 2.3 * DBL_MAX_10_EXP) return HUGE_VAL;
    return (exp(bcalc));
}
```

This code is used in section 252.

278. *twoprime* converts the true albedo a , optical depth b to the reduced albedo ap and reduced optical depth bp that correspond to $g = 0$.

$\langle \text{Prototype for } twoprime \text{ 278} \rangle \equiv$

```
void twoprime(double a, double b, double g, double *ap, double *bp)
```

This code is used in sections 253 and 279.

279. $\langle \text{Definition for } twoprime \text{ 279} \rangle \equiv$
 $\langle \text{Prototype for } twoprime \text{ 278} \rangle$

```
{
    if (a  $\equiv$  1  $\wedge$  g  $\equiv$  1) *ap = 0.0;
    else *ap = (1 - g) * a / (1 - a * g);
    if (b  $\equiv$  HUGE_VAL) *bp = HUGE_VAL;
    else *bp = (1 - a * g) * b;
}
```

This code is used in section 252.

280. *twounprime* converts the reduced albedo *ap* and reduced optical depth *bp* (for $g = 0$) to the true albedo *a* and optical depth *b* for an anisotropy *g*.

⟨Prototype for *twounprime* 280⟩ ≡

```
void twounprime(double ap, double bp, double g, double *a, double *b)
```

This code is used in sections 253 and 281.

281. ⟨Definition for *twounprime* 281⟩ ≡

⟨Prototype for *twounprime* 280⟩

```
{
    *a = ap / (1 - g + ap * g);
    if (bp == HUGE_VAL) *b = HUGE_VAL;
    else *b = (1 + ap * g / (1 - g)) * bp;
}
```

This code is used in section 252.

282. *abgg2ab* assume *a*, *b*, *g*, and *g1* are given this does the similarity translation that you would expect it should by converting it to the reduced optical properties and then transforming back using the new value of *g*

⟨Prototype for *abgg2ab* 282⟩ ≡

```
void abgg2ab(double a1, double b1, double g1, double g2, double *a2, double *b2)
```

This code is used in sections 253 and 283.

283. ⟨Definition for *abgg2ab* 283⟩ ≡

⟨Prototype for *abgg2ab* 282⟩

```
{
    double a, b;
    twoprime(a1, b1, g1, &a, &b);
    twounprime(a, b, g2, a2, b2);
}
```

This code is used in section 252.

284. *abgb2ag* translates reduced optical properties to unreduced values assuming that the new optical thickness is given i.e., *a1* and *b1* are *a'* and *b'* for $g = 0$. This routine then finds the appropriate anisotropy and albedo which correspond to an optical thickness *b2*.

If both *b1* and *b2* are zero then just assume $g = 0$ for the unreduced values.

⟨Prototype for *abgb2ag* 284⟩ ≡

```
void abgb2ag(double a1, double b1, double b2, double *a2, double *g2)
```

This code is used in sections 253 and 285.

285. $\langle \text{Definition for } abgb2ag \text{ } 285 \rangle \equiv$
 $\langle \text{Prototype for } abgb2ag \text{ } 284 \rangle$

312. Index. Here is a cross-reference table for the inverse adding-doubling program. All sections in which an identifier is used are listed with that identifier, except that reserved words are indexed only when they appear in format definitions, and the appearances of identifiers in section names are not indexed. Underlined entries correspond to where the identifier was declared. Error messages and a few other things like “ASCII code dependencies” are indexed here too.
