 $\S1$ IAD (v 3-13-1) IAD PROGRAM 1

1. iad program.

Here is a relatively robust command-line utility that shows how the iad and ad subroutines might be called. It suffers because it is written in CWEB and I used the macro expansion feature instead of creating separate functions. Oh well.

I create an empty file iad_main.h to simplify the Makefile \langle iad_main.h $\rangle \equiv$

```
2. All the actual output for this web file goes into iad_main.c
```

```
\langle iad_main.c \rangle \equiv
  \langle Include files for main 3\rangle
   (print version function 20)
   (print usage function 21)
   (stringdup together function 27)
   \langle seconds elapsed function 28\rangle
   (print error legend function 26)
   (print dot function 30)
   (calculate coefficients function 22)
   (parse string into array function 29)
  ⟨ print results header function 24 ⟩
  ⟨ Print results function 25⟩
  int main(int argc, char **argv)
     \langle \text{ Declare variables for } main | 4 \rangle
     (Handle options 5)
     Initialize\_Measure(\&m);
     \langle Command-line changes to m 18\rangle
     Initialize\_Result(m, \&r);
     \langle Command-line changes to r 13\rangle
     if (cl\_forward\_calc \neq UNINITIALIZED) {
       (Calculate and Print the Forward Calculation 6)
       return EXIT_SUCCESS;
     \langle prepare file for reading 10\rangle
     if (process_command_line) {
       (Count command-line measurements 19)
       (Calculate and write optical properties 11)
       return EXIT_SUCCESS;
     if (Read\_Header(stdin, \&m, \&params) \equiv 0) {
       start\_time = clock();
       while (Read\_Data\_Line(stdin, \&m, params) \equiv 0) {
           Command-line changes to m 18
          (Calculate and write optical properties 11)
       }
     if (cl\_verbosity > 0) fprintf(stderr, "\n");
     if (any\_error \land cl\_verbosity > 1) print\_error\_legend();
     return EXIT_SUCCESS;
```

2 IAD PROGRAM IAD (v 3-13-1) $\S 3$

The first two defines are to stop Visual C++ from silly complaints \langle Include files for $main 3 \rangle \equiv$ #define _CRT_SECURE_NO_WARNINGS #define _CRT_NONSTDC_NO_WARNINGS #define NO_SLIDES 0#define ONE_SLIDE_ON_TOP 1 #define TWO_IDENTICAL_SLIDES 2 #define ONE_SLIDE_ON_BOTTOM 3 #define ONE_SLIDE_NEAR_SPHERE 4 #define ONE_SLIDE_NOT_NEAR_SPHERE 5#define MR_IS_ONLY_RD 1 #define MT_IS_ONLY_TD 2 #define NO_UNSCATTERED_LIGHT 3#include <stdio.h> #include <string.h> #include <stdlib.h> #include <unistd.h> #include <time.h> #include <math.h> #include <ctype.h> #include "ad_globl.h" #include "ad_prime.h" #include "iad_type.h" #include "iad_pub.h" #include "iad_io.h" #include "iad_calc.h" #include "iad_util.h" #include "mygetopt.h" #include "version.h" #include "mc_lost.h" #include "ad_frsnl.h" See also section 32.

```

6. We are doing a forward calculation. We still need to set the albedo and optical depth appropriately. Obviously when the -a switch is used then the albedo should be fixed as a constant equal to *cl_default_a*. The other cases are less clear. If scattering and absorption are both specified, then calculate the albedo using these values. If the scattering is not specified, then we assume that the sample is an unscattering sample and therefore the albedo is zero. On the other hand, if the scattering is specified and the absorption is not, then the albedo is set to one.

```
 \begin{split} &\langle \, \text{Calculate and Print the Forward Calculation } \, 6 \, \rangle \equiv \\ & \quad \text{if } \, \left( \mathit{cl\_default\_a} \equiv \text{UNINITIALIZED} \right) \, \left\{ \\ & \quad \text{if } \, \left( \mathit{cl\_default\_mus} \equiv \text{UNINITIALIZED} \right) \, r.a = 0; \\ & \quad \text{else if } \, \left( \mathit{cl\_default\_mua} \equiv \text{UNINITIALIZED} \right) \, r.a = 1; \\ & \quad \text{else } \, r.a = \, \mathit{cl\_default\_mus} / \left( \mathit{cl\_default\_mua} + \, \mathit{cl\_default\_mus} \right); \\ & \quad \text{else } \, r.a = \, \mathit{cl\_default\_a}; \\ & \quad \text{See also sections } 7, \, 8, \, \text{and } \, 9. \\ & \quad \text{This code is used in section } \, 2. \end{split}
```

 $\S7$ IAD (v 3-13-1) IAD PROGRAM

7

7. This is slightly more tricky because there are four things that can affect the optical thickness — $cl_default_b$, the default mua, default mus and the thickness. If the sample thickness is unspecified, then the only reasonable thing to do is to assume that the sample is very thick. Otherwise, we use the sample thickness to calculate the optical thickness.

```
\langle Calculate and Print the Forward Calculation _{6}\rangle +\equiv
  if (cl\_default\_b \equiv \mathtt{UNINITIALIZED}) {
     if (cl\_sample\_d \equiv \mathtt{UNINITIALIZED}) r.b = \mathtt{HUGE\_VAL};

§15 IAD (v 3-13-1)

15. Use Monte Carlo to figure out how much light leaks out. We use the sphere corrected values as the starting values and only do try Monte Carlo when spheres are used, the albedo unknown or non-zero, and there has been no error. The sphere parameters must be known because otherwise the beam size and the port size are unknown.

```

```

44. All the information that needs to be written to the header file iad_pub.h. This eliminates the need to maintain a set of header files as well.

```
 \begin{split} &\langle \text{iad\_pub.h} \quad 44 \rangle \equiv \\ &\langle \text{Prototype for } \textit{Inverse\_RT } \quad 46 \rangle; \\ &\langle \text{Prototype for } \textit{measure\_OK } \quad 51 \rangle; \\ &\langle \text{Prototype for } \textit{determine\_search } \quad 58 \rangle; \\ &\langle \text{Prototype for } \textit{Initialize\_Result } \quad 62 \rangle; \\ &\langle \text{Prototype for } \textit{ez\_Inverse\_RT } \quad 68 \rangle; \\ &\langle \text{Prototype for } \textit{Initialize\_Measure } \quad 70 \rangle; \\ &\langle \text{Prototype for } \textit{Calculate\_MR\_MT } \quad 79 \rangle; \\ &\langle \text{Prototype for } \textit{MinMax\_MR\_MT } \quad 83 \rangle; \\ &\langle \text{Prototype for } \textit{Calculate\_Minimum\_MR } \quad 81 \rangle; \\ &\langle \text{Prototype for } \textit{Spheres\_Inverse\_RT2 } \quad 85 \rangle; \end{split}
```

45. Here is the header file needed to access one interesting routine in the libiad.so library.

```
⟨lib_iad.h 45⟩ ≡
⟨Prototype for ez_Inverse_RT 68⟩;
⟨Prototype for Spheres_Inverse_RT 72⟩;
⟨Prototype for Spheres_Inverse_RT2 85⟩;
```

 $\S46$ IAD (v 3-13-1) INVERSE RT 31

46. Inverse RT. $Inverse_RT$ is the main function in this whole package. You pass the variable m containing your experimentally measured values to the function $Inverse_RT$. It hopefully returns the optical properties in r that are appropriate for your experiment.

```
\langle Prototype for Inverse\_RT 46 \rangle \equiv
  void Inverse_RT(struct measure_type m, struct invert_type *r)
This code is used in sections 44 and 47.
47. \langle \text{ Definition for } Inverse\_RT | 47 \rangle \equiv
  \langle \text{ Prototype for } Inverse\_RT | 46 \rangle
     if (0 \land Debug(DEBUG\_LOST\_LIGHT)) {
        fprintf(stderr, "** \bot Inverse_RT \bot (%d \bot spheres) \bot ** \land ", m.num\_spheres);
       fprintf(stderr, "uuuuuUR1_ulost_u=u%8.5f, uUT1_ulost_u=u%8.5f \n", m.ur1_lost, m.ut1_lost);
     r \rightarrow found = FALSE;
     if (r \rightarrow search \equiv FIND\_AUTO) r \rightarrow search = determine\_search(m, *r);
     if (r \rightarrow search \equiv FIND_B_WITH_NO_ABSORPTION) {
        r \rightarrow default_a = 1;
        r \rightarrow search = FIND_B;
     if (r \rightarrow search \equiv FIND_B_WITH_NO_SCATTERING) {
        r \rightarrow default_a = 0;
        r \rightarrow search = FIND_B;
     (Exit with bad input data 48)
     (Find the optical properties 49)
     if (r \rightarrow final\_distance \leq r \rightarrow tolerance) r \rightarrow found = TRUE;
This code is used in section 43.
```

48. There is no sense going to all the trouble to try a multivariable minimization if the input data is bogus. So I wrote a single routine $measure_OK$ to do just this.

```
 \begin{split} &\langle \text{ Exit with bad input data } 48 \rangle \equiv \\ &r \neg error = measure\_OK(m,*r); \\ &\textbf{if } (r \neg method.quad\_pts < 4) \ r \neg error = \texttt{IAD\_QUAD\_PTS\_NOT\_VALID}; \\ &\textbf{if } (r \neg error \neq \texttt{IAD\_NO\_ERROR}) \ \textbf{return}; \end{split}  This code is used in section 47.
```

32 INVERSE RT IAD (v 3-13-1) §49

49. Now I fob the real work off to the unconstrained minimization routines. Ultimately, I would like to replace all these by constrained minimization routines. Actually the first five already are constrained. The real work will be improving the last five because these are 2-D minimization routines.

```
\langle Find the optical properties 49 \rangle \equiv
  switch (r→search) {
  case FIND_A: U_Find_A(m,r);
    break;
  case FIND_B: U_Find_B(m,r);
    break;
  case FIND_G: U_Find_G(m,r);
    break;
  case FIND\_Ba: U\_Find\_Ba(m,r);
    break;
  case FIND\_Bs: U\_Find\_Bs(m,r);
    break;
  case FIND_AB: U_Find_AB(m,r);
    break:
  case FIND_AG: U_Find_AG(m,r);
    break;
  case FIND_BG: U_Find_BG(m,r);
  case FIND\_BsG: U\_Find\_BsG(m,r);
    break;
  case FIND\_BaG: U\_Find\_BaG(m,r);
    break;
  if (r \rightarrow iterations \equiv IAD\_MAX\_ITERATIONS) r \rightarrow error = IAD\_TOO\_MANY\_ITERATIONS;
This code is used in section 47.
```

 $\S50$ IAD (v 3-13-1) VALIDATION 33

50. Validation.

51. Now the question is — just what is bad data? Here's the prototype. $\langle \operatorname{Prototype for } measure_OK | 51 \rangle \equiv$ int $measure_OK (\mathbf{struct measure_type} \ m, \mathbf{struct invert_type} \ r)$ This code is used in sections 44 and 52.

52. It would just be nice to stop computing with bad data. This does not work in practice because it turns out that there is often bogus data in a full wavelength scan. Often the reflectance is too low for short wavelengths and at long wavelengths the detector (photomultiplier tube) does not work worth a damn.

The two sphere checks are more complicated. For example, we can no longer categorically state that the transmittance is less than one or that the sum of the reflectance and transmittance is less than one. Instead we use the transmittance to bound the values for the reflectance — see the routine $MinMax_MR_MT$ below.

```
⟨ Definition for measure_OK 52 ⟩ ≡
⟨ Prototype for measure_OK 51 ⟩ {
    double ru, tu;
    if (m.num\_spheres \neq 2) {
        ⟨ Check MT for zero or one spheres 54 ⟩
        ⟨ Check MR for zero or one spheres 53 ⟩ }
    else {
        int error = MinMax\_MR\_MT(m, r);
        if (error \neq IAD\_NO\_ERROR) return error;
    }
    ⟨ Check MU 55 ⟩
    if (m.num\_spheres \neq 0) {
        ⟨ Check sphere parameters 56 ⟩
    }
    return IAD\_NO\_ERROR;
}

This code is used in section 43.
```

34 Validation iad (v 3-13-1) §53

53. The reflectance is constrained by the index of refraction of the material and the transmission. The upper bound for the reflectance is just one minus the transmittance. The specular (unscattered) reflectance from the boundaries imposes minimum for the reflectance. Obviously, the reflected light cannot be less than that from the first boundary. This might be calculated by assuming an infinite layer thickness. But we can do better

There is a definite bound on the minimum reflectance from a sample. If you have a sample with a given transmittance m_-t , the minimum reflectance possible is found by assuming that the sample does not scatter any light.

Knowledge of the indicies of refraction makes it a relatively simple matter to determine the optical thickness $b = mu_-a * d$ of the slab. The minimum reflection is obtained by including all the specular reflectances from all the surfaces

If the default albedo has been specified as zero, then there is really no need to check MR because it is gnored.

```
 \left\{ \begin{array}{l} \textbf{Check MR for zero or one spheres 53} \right\} \equiv \left\{ \\ \textbf{double } mr, mt; \\ \textbf{Calculate\_Minimum\_MR}(m,r,\&mr,\&mt); \\ /* \text{ one parameter search only needs one good measurement } */ \\ \textbf{if } (r.search \equiv \texttt{FIND\_A} \lor r.search \equiv \texttt{FIND\_G} \lor r.search \equiv \texttt{FIND\_B} \lor r.search \equiv FIND\_Ba) \left\{ \\ \textbf{if } (m.m\_r < mr \land m.m\_t \leq 0) \ \textbf{return IAD\_MR\_TOO\_SMALL}; \\ \right\} \\ \textbf{else } \left\{ \\ \textbf{if } (r.default\_a \equiv \texttt{UNINITIALIZED} \lor r.default\_a > 0) \left\{ \\ \textbf{if } (m.m\_r < mr) \ \textbf{return IAD\_MR\_TOO\_SMALL}; \\ \right\} \\ \right\} \\ \right\} \\ \right\} \\ \right\}
```

This code is used in section 52.

54. The transmittance is also constrained by the index of refraction of the material. The minimum transmittance is zero, but the maximum transmittance cannot exceed the total light passing through the sample when there is no scattering or absorption. This is calculated by assuming an infinitely thin (to eliminate any scattering or absorption effects).

There is a problem when spheres are present. The estimated values for the transmittance using Sp_mu_RT are not actually limiting cases. This will require a bit of fixing, but for now that test is omitted if the number of spheres is more than zero.

 $\S55$ IAD (v 3-13-1) VALIDATION 35

The unscattered transmission is now always included in the total transmittance. Therefore the unscattered transmittance must fall betwee zero and M_T

```
\langle Check MU 55\rangle \equiv
  if (m.m_u < 0) return IAD_MU_TOO_SMALL;
  if (m.m_{-}u > m.m_{-}t) return IAD_MU_TOO_BIG;
This code is used in section 52.
```

Make sure that reflection sphere parameters are reasonable

```
\langle Check sphere parameters 56 \rangle \equiv
  if (m.as_r < 0 \lor m.as_r \ge 0.2) return IAD_AS_NOT_VALID;
  if (m.ad\_r < 0 \lor m.ad\_r > 0.2) return IAD_AD_NOT_VALID;
  if (m.ae\_r < 0 \lor m.ae\_r \ge 0.2) return IAD_AE_NOT_VALID;
  if (m.rw_r < 0 \lor m.rw_r > 1.0) return IAD_RW_NOT_VALID;
  if (m.rd_{-}r < 0 \lor m.rd_{-}r > 1.0) return IAD_RD_NOT_VALID;
  if (m.rstd_r < 0 \lor m.rstd_r > 1.0) return IAD_RSTD_NOT_VALID;
  if (m.rstd_{-}t < 0 \lor m.rstd_{-}t > 1.0) return IAD_TSTD_NOT_VALID;
  if (m.f_r < 0 \lor m.f_r > 1) return IAD_F_NOT_VALID;
See also section 57.
```

This code is used in section 52.

Make sure that transmission sphere parameters are reasonable

```
\langle Check sphere parameters 56\rangle + \equiv
  if (m.as_t < 0 \lor m.as_t \ge 0.2) return IAD_AS_NOT_VALID;
  if (m.ad_{-}t < 0 \lor m.ad_{-}t \ge 0.2) return IAD_AD_NOT_VALID;
  if (m.ae_{-}t < 0 \lor m.ae_{-}t \ge 0.2) return IAD_AE_NOT_VALID;
  if (m.rw_t < 0 \lor m.rw_r > 1.0) return IAD_RW_NOT_VALID;
  if (m.rd_{-}t < 0 \lor m.rd_{-}t > 1.0) return IAD_RD_NOT_VALID;
  if (m.rstd_{-}t < 0 \lor m.rstd_{-}t > 1.0) return IAD_TSTD_NOT_VALID;
  if (m.f_-t < 0 \lor m.f_-t > 1) return IAD_F_NOT_VALID;
```

36 Searching method iad (v 3-13-1) §58

58. Searching Method.

The original idea was that this routine would automatically determine what optical parameters could be figured out from the input data. This worked fine for a long while, but I discovered that often it was convenient to constrain the optical properties in various ways. Consequently, this routine got more and more complicated.

What should be done is to figure out whether the search will be 1D or 2D and split this routine into two parts.

It would be nice to enable the user to constrain two parameters, but the infrastructure is missing at this point.

```
\langle Prototype for determine\_search 58\rangle \equiv search_type determine\_search(struct measure_type m, struct invert_type r) This code is used in sections 44 and 59.
```

37

59. This routine is responsible for selecting the appropriate optical properties to determine.

```
\langle \text{ Definition for } determine\_search | 59 \rangle \equiv
   ⟨ Prototype for determine_search 58⟩
     double rt, tt, rd, td, tc, rc;
     int search = 0:
     int independent = m.num\_measures;

```

38 SEARCHING METHOD IAD (v 3-13-1) $\S59$

60. The fastest inverse problems are those in which just one measurement is known. This corresponds to a simple one-dimensional minimization problem. The only complexity is deciding exactly what should be allowed to vary. The basic assumption is that the anisotropy has been specified or will be assumed to be zero

If the anistropy is assumed known, then one other assumption will allow us to figure out the last parameter to solve for.

Ultimately, if no default values are given, then we look at the value of the total transmittance. If this is zero, then we assume that the optical thickness is infinite and solve for the albedo. Otherwise we will just make a stab at solving for the optical thickness assuming the albedo is one.

```
⟨One parameter search 60⟩ ≡ if (r.default_a \neq \text{UNINITIALIZED}) {
  if (r.default_a \equiv 0) search = \text{FIND\_B\_WITH\_NO\_SCATTERING};
  else if (r.default_a \equiv 1) search = \text{FIND\_B\_WITH\_NO\_ABSORPTION};
  else if (tt \equiv 0) search = \text{FIND\_G};
  else search = \text{FIND\_B};
}
else if (r.default_b \neq \text{UNINITIALIZED}) search = \text{FIND\_A};
  else if (r.default_b \neq \text{UNINITIALIZED}) search = \text{FIND\_Ba};
  else if (r.default_b a \neq \text{UNINITIALIZED}) search = \text{FIND\_Ba};
  else if (td \equiv 0) search = \text{FIND\_A};
  else if (td \equiv 0) search = \text{FIND\_B\_WITH\_NO\_SCATTERING};
  else search = \text{FIND\_B\_WITH\_NO\_ABSORPTION};
This code is used in section 59.
```

 $\S61$ IAD (v 3-13-1) SEARCHING METHOD 39

61. If the absorption depth $\mu_a d$ is constrained return $FIND_-BsG$. Recall that I use the bizarre mnemonic $bs = \mu_s d$ here and so this means that the program will search over various values of $\mu_s d$ and g.

If there are just two measurements then I assume that the anisotropy is not of interest and the only thing to calculate is the reduced albedo and optical thickness based on an assumed anisotropy.

```
\langle \text{Two parameter search } 61 \rangle \equiv
  if (r.default_a \neq UNINITIALIZED) {
     if (r.default_a \equiv 0) search = FIND_B;
     else if (r.default\_g \neq UNINITIALIZED) search = FIND_B;
     else search = FIND_BG;
  else if (r.default_b \neq UNINITIALIZED) {
     if (r.default\_g \neq UNINITIALIZED) search = FIND\_A;
     else search = FIND\_AG;
  else if (r.default_ba \neq UNINITIALIZED) {
     if (r.default\_g \neq UNINITIALIZED) search = FIND\_Bs;
     else search = FIND_{-}BsG;
  else if (r.default_bs \neq \texttt{UNINITIALIZED}) {
     if (r.default\_g \neq UNINITIALIZED) search = FIND\_Ba;
     else search = FIND\_BaG;
  else if (rt + tt > 1 \land 0 \land m.num\_spheres \neq 2) search = FIND_B_WITH_NO_ABSORPTION;
  else search = FIND_AB;
This code is used in section 59.
```

62. This little routine just stuffs reasonable values into the structure we use to return the solution. This does not replace the values for $r.default_g$ nor for $r.method.quad_pts$. Presumably these have been set correctly elsewhere.

```
⟨ Prototype for Initialize_Result 62 ⟩ ≡ void Initialize_Result (struct measure_type m, struct invert_type *r)
This code is used in sections 44 and 63.
63. ⟨ Definition for Initialize_Result 63 ⟩ ≡ ⟨ Prototype for Initialize_Result 62 ⟩ { ⟨ Fill r with reasonable values 64 ⟩ }
This code is used in section 43.
64. Start with the optical properties.
⟨ Fill r with reasonable values 64 ⟩ ≡ r → a = 0.0; r → b = 0.0; r → g = 0.0;
r → g = 0.0;
```

See also sections 65, 66, and 67. This code is used in section 63.

40 Searching method iad (v 3-13-1) $\S65$

```

 $\S68$ IAD (v 3-13-1) EZ INVERSE RT 41

68. EZ Inverse RT. *ez_Inverse_RT* is a simple interface to the main function *Inverse_RT* in this package. It eliminates the need for complicated data structures so that the command line interface (as well as those to Perl and Mathematica) will be simpler. This function assumes that the reflection and transmission include specular reflection and that the transmission also include unscattered transmission.

Other assumptions are that the top and bottom slides have the same index of refraction, that the illumination is collimated. Of course no sphere parameters are included.

```
| A continuation is collimated. Of course no sphere parameters are included.
| A couple | A

83. The minimum possible value of MR for a given MT will be when the albedo is zero and the maximum value will be when the albedo is one. In the first case there will be no light loss and in the second we will assume that any light loss is neglible (to maximize MR).

The second case is perhaps over-simplified. Obviously for a fixed thickness as the albedo increases, the reflectance will increase. So how does $U_-Find_-B()$ work when the albedo is set to 1?

The problem is that to calculate these values one must know the optical thickness. Fortunately with the recent addition of constrained minimization, we can do exactly this.

The only thing that remains is to sort out the light lost effect.

95. Reading the file header.

```
96. ⟨Prototype for Read_Header 96⟩ ≡
int Read_Header(FILE *fp, struct measure_type *m, int *params)
This code is used in sections 94 and 97.
```

97. Pretty straightforward stuff. The only thing that needs to be commented on is that only one slide thickness/index is specified in the file. This must be applied to both the top and bottom slides. Finally, to specify no slide, then either setting the slide index to 1.0 or the thickness to 0.0 should do the trick.

```

62 Initialization iad (v 3-13-1) $\S118$

118. Initialization.

The functions in this file assume that the local variables MM and RR have been initialized appropriately. The variable MM contains all the information about how a particular experiment was done. The structure RR contains the data structure that is passed to the adding-doubling routines as well as the number of quadrature points.

history 6/8/94 changed error output to stderr.

119. Gain.

Assume that a sphere is illuminated with diffuse light having a power P. This light can reach all parts of sphere — specifically, light from this source is not blocked by a baffle. Multiple reflections in the sphere will increase the power falling on non-white areas in the sphere (e.g., the sample, detector, and entrance) To find the total we need to sum all the total of all incident light at a point. The first incidence is

$$P_w^{(1)} = a_w P, \qquad P_s^{(1)} = a_s P, \qquad P_d^{(1)} = a_d P$$

The light from the detector and sample is multiplied by $(1 - a_e)$ and not by a_w because the light from the detector (and sample) is not allowed to hit either the detector or sample. The second incidence on the wall is

$$P_w^{(2)} = a_w r_w P_w^{(1)} + (1 - a_e) r_d P_d^{(1)} + (1 - a_e) r_s P_s^{(1)}$$

The light that hits the walls after k bounces has the same form as above

$$P_w^{(k)} = a_w r_w P_w^{(k-1)} + (1 - a_e) r_d P_d^{(k-1)} + (1 - a_e) r_s P_s^{(k-1)}$$

Since the light falling on the sample and detector must come from the wall

$$P_s^{(k)} = a_s r_w P_w^{(k-1)}$$
 and $P_d^{(k)} = a_d r_w P_w^{(k-1)}$

Therefore.

$$P_w^{(k)} = a_w r_w P_w^{(k-1)} + (1 - a_e) r_w (a_d r_d + a_s r_s) P_w^{(k-2)}$$

The total power falling on the walls is just

$$P_w = \sum_{k=1}^{\infty} P_w^{(k)} = \frac{a_w + (1 - a_e)(a_d r_d + a_s r_s)}{1 - a_w r_w - (1 - a_e)r_w(a_d r_d + a_s r_s)} P$$

The total power falling the detector is

$$P_d = a_d P + \sum_{k=2}^{\infty} a_d r_w P_w^{(k-1)} = a_d P + a_d r_w P_w$$

The gain $G(r_s)$ on the irradiance on the detector (relative to a black sphere),

$$G(r_s) \equiv \frac{P_d/A_d}{P/A}$$

in terms of the sphere parameters

$$G(r_s) = 1 + \frac{1}{a_w} \cdot \frac{a_w r_w + (1 - a_e) r_w (a_d r_d + a_s r_s)}{1 - a_w r_w - (1 - a_e) r_w (a_d r_d + a_s r_s)}$$

The gain for a detector in a transmission sphere is similar, but with primed parameters to designate a second potential sphere that is used. For a black sphere the gain G(0) = 1, which is easily verified by setting $r_w = 0$, $r_s = 0$, and $r_d = 0$. Conversely, when the sphere walls and sample are perfectly white, the irradiance at the entrance port, the sample port, and the detector port must increase so that the total power leaving via these ports is equal to the incident diffuse power P. Thus the gain should be the ratio of the sphere wall area over the area of the ports through which light leaves or $G(1) = A/(A_e + A_d)$ which follows immediately from the gain formula with $r_w = 1$, $r_s = 1$, and $r_d = 0$.

64 GAIN IAD (v 3-13-1) $\S120$

120. The gain $G(r_s)$ on the irradiance on the detector (relative to a black sphere),

$$G(r_s) \equiv \frac{P_d/A_d}{P/A}$$

in terms of the sphere parameters

$$G(r_s) = 1 + \frac{a_w r_w + (1 - a_e) r_w (a_d r_d + a_s r_s)}{1 - a_w r_w - (1 - a_e) r_w (a_d r_d + a_s r_s)}$$

 $\langle \text{ Prototype for } Gain | 120 \rangle \equiv$

double Gain(int sphere, struct measure_type m, double URU)

This code is used in sections 117 and 121.

This code is used in section 116.

122. The gain for light on the detector in the first sphere for diffuse light starting in that same sphere is defined as

$$G_{1\to 1}(r_s, t_s) \equiv \frac{P_{1\to 1}(r_s, t_s)/A_d}{P/A}$$

then the full expression for the gain is

$$G_{1\to 1}(r_s, t_s) = \frac{G(r_s)}{1 - a_s a_s' r_w r_w' (1 - a_e) (1 - a_s') G(r_s) G'(r_s) t_s^2}$$

 $\langle \text{ Prototype for } Gain_11 \text{ 122} \rangle \equiv$

double Gain_11 (struct measure_type m, double URU, double tdiffuse)

This code is used in sections 117 and 123.

 $\S123$ IAD (v 3-13-1) GAIN 65

```
123. \langle Definition for Gain\_11 \ 123 \rangle \equiv \langle Prototype for Gain\_11 \ 122 \rangle = \langle Prototype for Gain\_11 \ 122 \rangle = \langle double G, GP, G11; G = Gain (\texttt{REFLECTION\_SPHERE}, m, \texttt{URU}); \texttt{GP} = Gain (\texttt{TRANSMISSION\_SPHERE}, m, \texttt{URU}); \texttt{G11} = G/(1 - m.as\_r * m.as\_t * m.aw\_r * m.aw\_t * (1 - m.ae\_r) * (1 - m.ae\_t) * G * \texttt{GP} * tdiffuse * tdiffuse); \texttt{return G11}; \} This code is used in section 116.
```

124. Similarly, when the light starts in the second sphere, the gain for light on the detector in the second sphere $G_{2\to 2}$ is found by switching all primed variables to unprimed. Thus $G_{2\to 1}(r_s,t_s)$ is

$$G_{2\to 2}(r_s,t_s) = \frac{G'(r_s)}{1 - a_s a_s' r_w r_w' (1 - a_e) (1 - a_e') G(r_s) G'(r_s) t_s^2}$$

 $\langle \text{ Prototype for } Gain_222 \text{ 124} \rangle \equiv$

double Gain_22 (struct measure_type m, double URU, double tdiffuse)

This code is used in sections 117 and 125.

```
125. \langle Definition for Gain\_22\ 125\rangle \equiv \langle Prototype for Gain\_22\ 124\rangle { double G, GP, G22; G = Gain(\texttt{REFLECTION\_SPHERE}, m, \texttt{URU}); \\ \text{GP} = Gain(\texttt{TRANSMISSION\_SPHERE}, m, \texttt{URU}); \\ \text{G22} = \texttt{GP}/(1-m.as\_r*m.as\_t*m.aw\_r*m.aw\_t*(1-m.ae\_r)*(1-m.ae\_t)*G*\texttt{GP}*tdiffuse*tdiffuse); \\ \text{return G22}; \\ \}
```

This code is used in section 116.

126. The reflected power for two spheres makes use of the formulas for Gain_11 above.

The light on the detector in the reflection (first) sphere arises from three sources: the fraction of light directly reflected off the sphere wall $fr_w^2(1-a_e)P$, the fraction of light reflected by the sample $(1-f)r_s^{\text{direct}}r_w^2(1-a_e)P$, and the light transmitted through the sample $(1-f)t_s^{\text{direct}}r_w^2(1-a_e)P$,

$$\begin{split} R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= G_{1 \rightarrow 1}(r_s, t_s) \cdot a_d (1 - a_e) r_w^2 f P \\ &+ G_{1 \rightarrow 1}(r_s, t_s) \cdot a_d (1 - a_e) r_w (1 - f) r_s^{\text{direct}} P \\ &+ G_{2 \rightarrow 1}(r_s, t_s) \cdot a_d (1 - a_e') r_w' (1 - f) t_s^{\text{direct}} P \end{split}$$

which simplifies slightly to

$$\begin{split} R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= a_d (1 - a_e) r_w P \cdot G_{1 \to 1}(r_s, t_s) \\ &\times \left[(1 - f) r_s^{\text{direct}} + f r_w + (1 - f) a_s' (1 - a_e') r_w' t_s^{\text{direct}} t_s G'(r_s) \right] \end{split}$$

 $\langle Prototype for Two_Sphere_R 126 \rangle \equiv$

 $\label{local_conditions} \begin{tabular}{ll} \bf double \ \it Two_Sphere_R (struct \ measure_type \ \it m, double \ \tt UR1, double \ \tt URU, double \ \tt UT1, double \ \tt UTU) \\ This code is used in sections 117 and 127. \\ \end{tabular}$

66 GAIN IAD (v 3-13-1) $\S127$

This code is used in section 116.

128. For the power on the detector in the transmission (second) sphere we have the same three sources. The only difference is that the subscripts on the gain terms now indicate that the light ends up in the second sphere

$$\begin{split} T(r_s^{\text{ direct}}, r_s, t_s^{\text{ direct}}, t_s) &= G_{1 \rightarrow 2}(r_s, t_s) \cdot a_d' (1 - a_e) r_w^2 f P \\ &+ G_{1 \rightarrow 2}(r_s, t_s) \cdot a_d' (1 - a_e) r_w (1 - f) r_s^{\text{ direct}} P \\ &+ G_{2 \rightarrow 2}(r_s, t_s) \cdot a_d' (1 - a_e') r_w' (1 - f) t_s^{\text{ direct}} P \end{split}$$

or

$$\begin{split} T(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) &= a_d' (1 - a_e') r_w' P \cdot G_{2 \to 2}(r_s, t_s) \\ &\times \left[(1 - f) t_s^{\text{direct}} + (1 - a_e) r_w a_s t_s (f r_w + (1 - f) r_s^{\text{direct}}) G(r_s) \right] \end{split}$$

 $\langle Prototype for Two_Sphere_T 128 \rangle \equiv$

double Two_Sphere_T (struct measure_type m, double UR1, double URU, double UT1, double UTU) This code is used in sections 117 and 129.

```
129. \langle Definition for Two\_Sphere\_T 129\rangle \equiv \langle Prototype for Two\_Sphere\_T 128\rangle \{ double x, G; G = Gain(\texttt{REFLECTION\_SPHERE}, m, \texttt{URU}); x = m.ad\_t * (1 - m.ae\_t) * m.rw\_t * Gain\_22(m, \texttt{URU}, \texttt{UTU}); x *= (1 - m.f\_r) * \texttt{UT1} + (1 - m.ae\_r) * m.rw\_r * m.as\_r * \texttt{UTU} * (m.f\_r * m.rw\_r + (1 - m.f\_r) * \texttt{UR1}) * G; return x; \}
```

This code is used in section 116.

 $\S130$ IAD (v 3-13-1) GRID ROUTINES 67

130. Grid Routines. There is a long story associated with these routines. I spent a lot of time trying to find an empirical function to allow a guess at a starting value for the inversion routine. Basically nothing worked very well. There were too many special cases and what not. So I decided to calculate a whole bunch of reflection and transmission values and keep their associated optical properties linked nearby.

I did the very simplest thing. I just allocate a matrix that is five columns wide. Then I fill every row with a calculated set of optical properties and observables. The distribution of values that I use could certainly use some work, but they currently work.

SO... how does this thing work anyway? There are two possible grids one for calculations requiring the program to find the albedo and the optical depth (a and b) and one to find the albedo and anisotropy (a and g). These grids must be allocated and initialized before use.

131. This is a pretty important routine that should have some explanation. The reason that it exists, is that we need some 'out-of-band' information during the minimization process. Since the light transport calculation depends on all sorts of stuff (e.g., the sphere parameters) and the minimization routines just vary one or two parameters this information needs to be put somewhere.

I chose the global variables MM and RR to save things in.

This code is used in section 116.

The bottom line is that you cannot do a light transport calculation without calling this routine first.

```
\langle Prototype for Set\_Calc\_State\ 131\rangle \equiv void Set\_Calc\_State(struct measure_type m, struct invert_type r)

141. This routine is used to figure out if the current grid is valid. This can fail for several reasons. First the grid may not have been allocated. Or it may not have been initialized. The boundary conditions may have changed. The number or values of the sphere parameters may have changed. It is tedious, but straightforward to check these cases out.

If this routine returns true, then it is a pretty good bet that the values in the current grid can be used to guess the next starting set of values.

151. Routine to incorporate flipping of sample if needed. This is pretty simple. The assumption is that flipping is handled relative to the reflection side of the sphere. Thus even when flipping is needed, the usual call to RT() will result in the correct values for the reflectances. The transmission values can then be calculated by swapping the top and bottom slides.

Technically, the value of slab should be **const** but it is not so that we don't pay a copying overhead whenever *flip* is false (the usual case).

```

This code is used in section 116.
```

154. This routine fills the grid with a proper set of values. With a little work, this routine could be made much faster by (1) only generating the phase function matrix once, (2) Making only one pass through the array for each albedo value, i.e., using the matrix left over from b=1 to generate the solution for b=2. Unfortunately this would require a complete revision of the $Calculate_Distance$ routine. Fortunately, this routine should only need to be calculated once at the beginning of each run.

```
\langle \text{Prototype for } Fill\_AB\_Grid \ 154 \rangle \equiv 
void Fill\_AB\_Grid (\text{struct measure\_type } m, \text{struct invert\_type } r)
This code is used in sections 116 and 155.
```

```
\langle \text{ Definition for } Fill\_AB\_Grid \ 155 \rangle \equiv
  \langle \text{ Prototype for } Fill\_AB\_Grid \ 154 \rangle
     int i, j;
     double a;
                                   /* \exp(-10) is smallest thickness */
     double min_b = -8;
     double max_b = +8;
                                   /* \exp(+8) is greatest thickness */
     if (Debug(Debug(DEBUG_GRID))) fprintf(stderr, "Filling_AB_grid\n");
     if (The\_Grid \equiv \Lambda) Allocate\_Grid(r.search);
     \langle \text{Zero } GG | 161 \rangle

        for (j = 0; j < GRID\_SIZE; j \leftrightarrow) {
            Generate next albedo using j 157
          fill\_grid\_entry(i, j);
     The\_Grid\_Initialized = TRUE;
     The\_Grid\_Search = FIND\_AB;
This code is used in section 116.
```

156. Now it seems that I must be a bit more subtle in choosing the range of albedos to use in the grid. Originally I just spaced them according to

$$a = 1 - \left[\frac{j-1}{n-1}\right]^3$$

where $1 \le j \le n$. Long ago it seems that I based things only on the square of the bracketed term, but I seem to remember that I was forced to change it from a square to a cube to get more global convergence.

So why am I rewriting this? Well, because it works very poorly for samples with small albedos. For example, when n = 11 then the values chosen for a are (1, .999, .992, .973, .936, .875, .784, .657, .488, .271, 0). Clearly very skewed towards high albedos.

I am considering a two part division. I'm not too sure how it should go. Let the first half be uniformly divided and the last half follow the cubic scheme given above. The list of values should then be (1, .996, .968, .892, 0.744, .5, .4, .3, .2, .1, 0).

Maybe it would be best if I just went back to a quadratic term. Who knows?

In the if statement below, note that it could read $j \ge k$ and still generate the same results.

```
 \begin{split} &\langle \, \text{Nonworking code 156} \, \rangle \equiv \\ &k = floor((\texttt{GRID\_SIZE} - 1)/2); \\ &\textbf{if } (j > k) \, \, \{ \\ &a = 0.5 * (1 - (j - k - 1)/(\texttt{GRID\_SIZE} - k - 1)); \\ &\texttt{RR}.slab.a = a; \\ &\} \\ &\textbf{else } \, \{ \\ &a = (j - 1.0)/(\texttt{GRID\_SIZE} - k - 1); \\ &\texttt{RR}.slab.a = 1.0 - a * a * a/2; \\ &\} \end{split}
```

76 GRID ROUTINES IAD (v 3-13-1) $\S157$

157. Well, the above code did not work well. So I futzed around and sort of empirically ended up using the very simple method below. The only real difference from the previous method what that the method is now quadratic and not cubic.

```
\langle \text{Generate next albedo using j 157} \rangle \equiv \\ a = (\mathbf{double}) \, j/(\mathsf{GRID\_SIZE} - 1.0); \\ \text{if } (a < 0.25) \, \text{RR}. slab. \\ a = 1.0 - a * a; \\ \text{else if } (a > 0.75) \, \text{RR}. slab. \\ a = (1.0 - a) * (1.0 - a); \\ \text{else RR}. slab. \\ a = 1 - a; \\ \text{See also section 158}. \\ \text{This code is used in sections 155 and 160}. \\ \\ \textbf{158.} \quad \text{Well, the above code has gaps. Here is an attempt to eliminate the gaps} \\ \langle \text{Generate next albedo using j 157} \rangle + \equiv \\ a = (\mathbf{double}) \, j/(\mathbf{GRID\_SIZE} - 1.0); \\ \mathbf{RR}. slab. \\ a = (1.0 - a * a) * (1.0 - a) + (1.0 - a) * (1.0 - a) * a; \\ \end{aligned}
```

159. This is quite similar to $Fill_AB_Grid$, with the exception of the little shuffle I do at the beginning to figure out the optical thickness to use. The problem is that the optical thickness may not be known. If it is known then the only way that we could have gotten here is if the user dictated FIND_AG and specified b and only provided two measurements. Otherwise, the user must have made three measurements and the optical depth can be figured out from $m.m_u$.

This routine could also be improved by not recalculating the anisotropy matrix for every point. But this would only end up being a minor performance enhancement if it were fixed.

```
\langle \text{Prototype for } Fill\_AG\_Grid \ 159 \rangle \equiv

```

82 CALCULATING R AND T IAD (v 3-13-1) $\S174$

174. This is the routine that actually finds the distance. I have factored this part out so that it can be used in the Near_Grid_Points routine.

Rc and Tc refer to the unscattered (collimated) reflection and transmission.

The only tricky part is to remember that the we are trying to match the measured values. The measured values are affected by sphere parameters and light loss. Since the values UR1 and UT1 are for an infinite slab sample with no light loss, the light loss out the edges must be subtracted. It is these values that are used with the sphere formulas to convert the modified UR1 and UT1 to values for *M_R and *M_T.

```
⟨ Prototype for Calculate_Distance_With_Corrections 174⟩ ≡ void Calculate_Distance_With_Corrections (double UR1, double UT1, double Rc, double Tc, double URU, double UTU, double *M_R, double *M_T, double *dev)
This code is used in sections 117 and 175.
```

```
\langle \text{ Definition for } Calculate\_Distance\_With\_Corrections | 175 \rangle \equiv
  ⟨ Prototype for Calculate_Distance_With_Corrections 174⟩
     double R\_direct, T\_direct, R\_diffuse, T\_diffuse;
     R\_diffuse = URU - MM.uru\_lost;
     T_{-}diffuse = UTU - MM.utu_{-}lost;
     R\_direct = UR1 - MM.ur1\_lost - (1.0 - MM.fraction\_of\_rc\_in\_mr) * Rc;
     T\_direct = \mathtt{UT1} - \mathtt{MM}.ut1\_lost - (1.0 - \mathtt{MM}.fraction\_of\_tc\_in\_mt) * Tc;
     switch (MM.num_spheres) {
     case 0: (Calc M_R and M_T for no spheres 176)
       break:
     case 1: case -2:
       if (MM.method \equiv COMPARISON) (Calc M_R and M_T for dual beam sphere 178)
       else (Calc M_R and M_T for single beam sphere 177)
     case 2: \langle Calc M_R and M_T for two spheres 179\,\rangle
       break;
     \langle \text{ Calculate the deviation } 180 \rangle
     (Print diagnostics 183)
This code is used in section 116.
```

176. If no spheres were used in the measurement, then presumably the measured values are the reflection and transmission. Consequently, we just acertain what the irradiance was and whether the specular reflection ports were blocked and proceed accordingly. Note that blocking the ports does not have much meaning unless the light is collimated, and therefore the reflection and transmission is only modified for collimated irradiance.

```
\langle \, {\rm Calc} \,\, {\rm M\_R} \,\, {\rm and} \,\, {\rm M\_T} \,\, {\rm for \,\, no \,\, spheres} \,\, 176 \, \rangle \equiv \\ *{\rm M\_R} \,= \, R\_direct \,; \\ *{\rm M\_T} \,= \, T\_direct \,; \\ {\rm This \,\, code \,\, is \,\, used \,\, in \,\, section \,\, 175}.
```

177. The direct incident power is (1-f)P. The reflected power will be $(1-f)r_s^{\text{direct}}P$. Since baffles ensure that the light cannot reach the detector, we must bounce the light off the sphere walls to use to above gain formulas. The contribution will then be $(1-f)r_s^{\text{direct}}(1-a_e)r_wP$. The measured power will be

$$P_d = a_d(1 - a_e)r_w[(1 - f)r_s^{\text{direct}} + fr_w]P \cdot G(r_s)$$

Similarly the power falling on the detector measuring transmitted light is

$$P'_d = a'_d t_s^{\text{direct}} r'_w (1 - a'_e) P \cdot G'(r_s)$$

when the 'entrance' port in the transmission sphere is closed, $a_e'=0$. The normalized sphere measurements are

$$M_R = r_{\text{std}} \cdot \frac{R(r_s^{\text{direct}}, r_s) - R(0, 0)}{R(r_{\text{std}}, r_{\text{std}}) - R(0, 0)}$$

and

This code is used in section 175.

$$M_T = t_{\text{std}} \cdot \frac{T(t_s^{\text{direct}}, r_s) - T(0, 0)}{T(t_{\text{std}}, r_{\text{std}}) - T(0, 0)}$$

```
 \left\{ \begin{array}{l} \text{double $P\_std$, $P\_d$, $P\_0$;} \\ \text{double $P\_std$, $P\_d$, $P\_0$;} \\ \text{double $G$, $G\_0$, $G\_std$, $GP\_std$, $GP$;} \\ \text{G\_0} = Gain(\texttt{REFLECTION\_SPHERE}, \texttt{MM}, 0.0);} \\ G = Gain(\texttt{REFLECTION\_SPHERE}, \texttt{MM}, R\_diffuse);} \\ G\_std = Gain(\texttt{REFLECTION\_SPHERE}, \texttt{MM}, R_diffuse);} \\ P\_d = G * (R\_direct * (1 - \texttt{MM}.f\_r) + \texttt{MM}.f\_r * \texttt{MM}.rw\_r);} \\ P\_std = G\_std * (\texttt{MM}.rstd\_r * (1 - \texttt{MM}.f\_r) + \texttt{MM}.f\_r * \texttt{MM}.rw\_r);} \\ P\_0 = G\_0 * (\texttt{MM}.f\_r * \texttt{MM}.rw\_r);} \\ *M\_R = \texttt{MM}.rstd\_r * (P\_d - P\_0)/(P\_std - P\_0);} \\ \text{GP} = Gain(\texttt{TRANSMISSION\_SPHERE}, \texttt{MM}, R\_diffuse);} \\ GP\_std = Gain(\texttt{TRANSMISSION\_SPHERE}, \texttt{MM}, 0.0);} \\ *M\_T = T\_direct * \texttt{GP}/GP\_std;} \\ \right\}
```

The dual beam case is different because the sphere efficiency is equivalent for measurement of light hitting the sample first or hitting the reference standard first. The dual beam measurement should report the ratio of these two reflectance measurements, thereby eliminating the need to calculate the gain completely. The same holds when no sample is present.

The normalized reflectance measurement (the difference between dual beam measurement for a port with the sample and with nothing) is

$$M_R = r_{\rm std} \cdot \frac{(1-f)r_s^{\rm direct} + fr_w}{(1-f')r_{\rm std} - f'r_w} - r_{\rm std} \cdot \frac{(1-f)(0) + fr_w}{(1-f')r_{\rm std} - f'r_w}$$

or

$$M_R = \frac{(1-f)r_s^{\text{direct}}}{(1-f') - f'r_w/r_{\text{std}}}$$

When f = f' = 1, then $M_R = 1$ no matter what the reflectance is. (Leave it in this form to avoid division by zero when f = 1.)

The normalized transmittance is simply t_s^{direct} .

When f = 0 then this result is essentially the same as the no spheres result (because no sphere corrections are needed). However if the number of spheres is zero, then no lost light calculations are made and therefore that is a potential error.

```
\langle Calc M_R and M_T for dual beam sphere 178 \rangle \equiv
       *\texttt{M\_R} = (1 - \texttt{MM}.f\_r) * R\_direct/((1 - \texttt{MM}.f\_r) + \texttt{MM}.f\_r * \texttt{MM}.rw\_r/\texttt{MM}.rstd\_r);
       *M_T = T_direct;
```

This code is used in section 175.

179. When two integrating spheres are present then the double integrating sphere formulas are slightly more complicated.

I am not sure what it means when $rstd_{-}t$ is not unity.

The normalized sphere measurements for two spheres are

$$M_R = \frac{R(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) - R(0, 0, 0, 0)}{R(r_{\text{std}}, r_{\text{std}}, 0, 0) - R(0, 0, 0, 0)}$$

and

$$M_T = \frac{T(r_s^{\text{direct}}, r_s, t_s^{\text{direct}}, t_s) - T(0, 0, 0, 0)}{T(0, 0, 1, 1) - T(0, 0, 0, 0)}$$

Note that R_0 and T_0 will be zero unless one has explicitly set the fraction $m.f_r$ ore $m.f_t$ to be non-zero.

```
\langle \text{Calc M\_R and M\_T for two spheres } 179 \rangle \equiv
                             double R_0, T_0;
                             R_0 = Two_Sphere_R(MM, 0, 0, 0, 0, 0);
                             T_0 = Two_Sphere_T(MM, 0, 0, 0, 0);
                             *M_R = MM.rstd_r * (Two\_Sphere_R(MM, R\_direct, R\_diffuse, T\_direct, R\_diffuse, T\_direct, R\_diffuse, T\_direct, R\_diffuse, T\_direct, R\_diffuse, R\_direct, R\_di
                                                             T_{-}diffuse) - R_{-}0)/(Two_{-}Sphere_{-}R(MM, MM.rstd_{-}r, MM.rstd_{-}r, 0, 0) - R_{-}0);
                             1) - T_0;
             }
```

This code is used in section 175.

This code is used in section 180.

180. There are at least three things that need to be considered here. First, the number of measurements. Second, is the metric is relative or absolute. And third, is the albedo fixed at zero which means that the transmission measurement should be used instead of the reflection measurement.

```
 \begin{array}{l} \langle \mbox{ Calculate the deviation } 180 \rangle \equiv \\ \mbox{ if } (\mbox{RR}.search \equiv \mbox{FIND\_A} \vee \mbox{RR}.search \equiv \mbox{FIND\_B} \vee \mbox{RR}.search \equiv \mbox{FIND\_B} \otimes \mbox{RR}.search \equiv \\ \mbox{FIND\_Ba} \rangle \ \{ \\ \mbox{ } \langle \mbox{ One parameter deviation } 181 \rangle \\ \mbox{ } \} \\ \mbox{ else } \{ \\ \mbox{ } \langle \mbox{ Two parameter deviation } 182 \rangle \\ \mbox{ } \} \\ \mbox{ This code is used in section } 175. \end{array}
```

181. This part was slightly tricky. The crux of the problem was to decide if the transmission or the reflection was trustworthy. After looking a bunches of measurements, I decided that the transmission measurement was almost always more reliable. So when there is just a single measurement known, then use the total transmission if it exists.

```
 \begin{split} &\langle \, \text{One parameter deviation 181} \, \rangle \equiv \\ & \quad \text{if } \left( \texttt{MM}.m_{-}t > 0 \right) \, \left\{ \\ & \quad \text{if } \left( \texttt{RR}.metric \equiv \texttt{RELATIVE} \right) \, *dev = fabs(\texttt{MM}.m_{-}t - *\texttt{M}_{-}\texttt{T})/(\texttt{MM}.m_{-}t + \texttt{ABIT}); \\ & \quad \text{else } *dev = fabs(\texttt{MM}.m_{-}t - *\texttt{M}_{-}\texttt{T}); \\ & \quad \text{else } \left\{ \\ & \quad \text{if } \left( \texttt{RR}.metric \equiv \texttt{RELATIVE} \right) \, *dev = fabs(\texttt{MM}.m_{-}r - *\texttt{M}_{-}\texttt{R})/(\texttt{MM}.m_{-}r + \texttt{ABIT}); \\ & \quad \text{else } *dev = fabs(\texttt{MM}.m_{-}r - *\texttt{M}_{-}\texttt{R}); \\ & \quad \} \end{split}
```

182. This stuff happens when we are doing two parameter searches. In these cases there should be information in both R and T. The distance should be calculated using the deviation from both. The albedo stuff might be able to be take out. We'll see.

86 CALCULATING R AND T IAD (v 3-13-1) §183

183. This is here so that I can figure out why the program is not converging. This is a little convoluted so that the global constants at the top of this file interact properly. $\langle \text{Print diagnostics } 183 \rangle \equiv$ if $((Debug(\mathtt{DEBUG_ITERATIONS}) \land \neg \mathtt{CALCULATING_GRID}) \lor$ $(Debuq(DEBUG_GRID_CALC) \land CALCULATING_GRID))$ { static int once = 0; if $(once \equiv 0)$ { $fprintf(stderr, "\%10s _\%10s _\%10s _ \%10s _ \$10s _$ "m_t", "fit", "delta"); once = 1; $fprintf(stderr, \%10.5f_{\square}\%10.5f_{\square}\%10.5f_{\square})$, RR.slab.a, RR.slab.b, RR.slab.g); $fprintf(stderr, "\%10.5f_{\square}\%10.5f_{\square}|", MM.m_r, *M_R);$ $fprintf(stderr, "\%10.5f_{\square}\%10.5f_{\square}|", MM.m_t, *M_T);$ $fprintf(stderr, "%10.5f_{\square}\n", *dev);$ This code is used in section 175. **184.** $\langle \text{Prototype for } Find_AG_fn \ 184 \rangle \equiv$ **double** $Find_AG_fn($ **double** x[])This code is used in sections 117 and 185. **185.** $\langle \text{ Definition for } Find_AG_fn \ 185 \rangle \equiv$ $\langle \text{ Prototype for } Find_AG_fn \ 184 \rangle$ **double** $m_{-}r$, $m_{-}t$, deviation; RR.slab.a = acalc2a(x[1]);RR.slab.g = gcalc2g(x[2]); $Calculate_Distance(\&m_r,\&m_t,\&deviation);$ **return** deviation; This code is used in section 116. **186.** $\langle \text{Prototype for } Find_AB_fn \ 186 \rangle \equiv$ **double** $Find_AB_fn($ **double** x[])This code is used in sections 117 and 187. $\langle \text{ Definition for } Find_AB_fn | 187 \rangle \equiv$ $\langle \text{ Prototype for } Find_AB_fn \text{ 186} \rangle$ **double** $m_{-}r$, $m_{-}t$, deviation; RR.slab.a = acalc2a(x[1]);RR.slab.b = bcalc2b(x[2]); $Calculate_Distance(\&m_r,\&m_t,\&deviation);$ **return** deviation; } This code is used in section 116.

188. $\langle \text{Prototype for } Find_Ba_fn \ 188 \rangle \equiv$ double $Find_Ba_fn(\text{double } x)$ This code is used in sections 117 and 189.

This is tricky only because the value in RR.slab.b is used to hold the value of bs or $d \cdot \mu_s$. It must be switched to the correct value for the optical thickness and then switched back at the end of the routine. $\langle \text{ Definition for } Find_Ba_fn 189 \rangle \equiv$ $\langle \text{ Prototype for } Find_Ba_fn \text{ 188} \rangle$

double m_-r , m_-t , deviation, ba, bs; bs = RR.slab.b;ba = bcalc2b(x);RR.slab.b = ba + bs;/* unswindle */ RR.slab.a = bs/(ba + bs); $Calculate_Distance(\&m_r,\&m_t,\&deviation);$ RR.slab.b = bs;/* swindle */ **return** deviation;

This code is used in section 116.

190. See the comments for the $Find_{-}Ba_{-}fn$ routine above. Play the same trick but use ba.

```
\langle \text{ Prototype for } Find\_Bs\_fn \ 190 \rangle \equiv

94 FIXED ANISOTROPY IAD (v 3-13-1) $\S 214$

214. Just get the optimal optical properties to start the search process.

I had to add the line that tests to make sure the albedo is greater than 0.2 because the grid just does not work so well in this case. The problem is that for low albedos there is really very little information about the anisotropy available. This change was also made in the analogous code for a and b.

220. Fixed Absorption and Anisotropy. Typically, this routine is called when the absorption coefficient is known, the anisotropy is known, and the physical thickness of the sample is known. This routine calculates the varies the scattering coefficient until the measurements are matched.

This was written for Ted Moffitt to analyze some intralipid data. We wanted to know what the scattering coefficient of the Intralipid was and made total transmission measurements through a sample with a fixed physical thickness. We did not make reflection measurements because the light source diverged too much, and we could not make reflection measurements easily.

In retrospect, we could have made URU measurements by illuminating the wall of the integrating sphere. However, these diffuse type of measurements are very difficult to make accurately.

This is tricky only because the value in slab.b is used to hold the value of ba or $d \cdot \mu_a$ when the $Find_Bs_fn$ is used.

224. Fixed Optical Depth and Anisotropy. Typically, this routine is called when the optical thickness is assumed infinite. However, it may also be called when the optical thickness is assumed to be fixed at a particular value. Typically the only reasonable situation for this to occur is when the diffuse transmission is non-zero but the collimated transmission is zero. If this is the case then there is no information in the collimated transmission measurement and there is no sense even using it because the slab is not infinitely thick.

102 fixed optical depth iad (v 3-13-1) §231

231. Fixed Optical Depth.

We can get here a couple of different ways.

First there can be three real measurements, i.e., t_c is not zero, in this case we want to fix b based on the t_c measurement.

Second, we can get here if a default value for b has been set.

Otherwise, we really should not be here. Just set b = 1 and calculate away.

254. Finding optical thickness.

This routine figures out what the optical thickness of a slab based on the index of refraction of the slab and the amount of collimated light that gets through it.

It should be pointed out right here in the front that this routine does not work for diffuse irradiance, but then the whole concept of estimating the optical depth for diffuse irradiance is bogus anyway.

In version 1.3 changed all error output to *stderr*. Version 1.4 included cases involving absorption in the boundaries.

```
#define BIG_A_VALUE 999999.0

#define SMALL_A_VALUE 0.000001

⟨Prototype for What_Is_B 254⟩ ≡
double What_Is_B (struct AD_slab_type slab, double Tc)

This code is used in sections 253 and 255.

255. ⟨Definition for What_Is_B 255⟩ ≡
⟨Prototype for What_Is_B 254⟩

{
double r1, r2, t1, t2, mu_in_slab;
⟨Calculate specular reflection and transmission 256⟩
⟨Check for bad values of Tc 257⟩
⟨Solve if multiple internal reflections are not present 258⟩
⟨Find thickness when multiple internal reflections are present 259⟩
}

This code is used in section 252.
```

256. The first thing to do is to find the specular reflection for light interacting with the top and bottom airglass-sample interfaces. I make a simple check to ensure that the indices are different before calculating the bottom reflection. Most of the time the $r1 \equiv r2$, but there are always those annoying special cases.

```
 \begin{split} &\langle \, \text{Calculate specular reflection and transmission 256} \,\rangle \equiv \\ &Absorbing\_Glass\_RT (1.0, slab.n\_top\_slide, slab.n\_slab, slab.cos\_angle, slab.b\_top\_slide, \&r1\,, \&t1\,); \\ &mu\_in\_slab = Cos\_Snell (1.0, slab.cos\_angle, slab.n\_slab); \\ &Absorbing\_Glass\_RT (slab.n\_slab, slab.n\_bottom\_slide, 1.0, mu\_in\_slab, slab.b\_bottom\_slide, \&r2\,, \&t2\,); \\ &\text{This code is used in section 255}. \end{split}
```

257. Bad values for the unscattered transmission are those that are non-positive, those greater than one, and those greater than are possible in a non-absorbing medium, i.e.,

$$T_c > \frac{t_1 t_2}{1 - r_1 r_2}$$

Since this routine has no way to report errors, I just set the optical thickness to the natural values in these cases.

```
\langle Check for bad values of Tc 257 \rangle \equiv if (Tc \leq 0) return (HUGE_VAL); if (Tc \geq t1 * t2/(1 - r1 * r2)) return (0.001); This code is used in section 255.
```

258. If either r1 or $r2 \equiv 0$ then things are very simple because the sample does not sustain multiple internal reflections and the unscattered transmission is

$$T_c = t_1 t_2 \exp(-b/\nu)$$

where b is the optical thickness and ν is $slab.cos_angle$. Clearly,

$$b = -\nu \ln \left(\frac{T_c}{t_1 t_2}\right)$$

 \langle Solve if multiple internal reflections are not present 258 \rangle \equiv

if $(r1 \equiv 0 \lor r2 \equiv 0)$ return $(-slab.cos_angle * log(Tc/t1/t2));$

This code is used in section 255.

259. Well I kept putting it off, but now comes the time to solve the following equation for b

$$T_c = \frac{t_1 t_2 \exp(-b)}{1 - r_1 r_2 \exp(-2b)}$$

We note immediately that this is a quadratic equation in $x = \exp(-b)$.

$$r_1 r_2 T_c x^2 + t_1 t_2 x - T_c = 0$$

Sufficient tests have been made above to ensure that none of the coefficients are exactly zero. However, it is clear that the leading quadratic term has a much smaller coefficient than the other two. Since r_1 and r_2 are typically about four percent the product is roughly 10^{-3} . The collimated transmission can be very small and this makes things even worse. A further complication is that we need to choose the only positive root.

Now the roots of $ax^2 + bx + c = 0$ can be found using the standard quadratic formula,

$$x = \frac{-b \pm \sqrt{b^2 - 4ac}}{2a}$$

This is very bad for small values of a. Instead I use

$$q = -\frac{1}{2} \left[b + \operatorname{sgn}(b) \sqrt{b^2 - 4ac} \right]$$

with the two roots

$$x = \frac{q}{a}$$
 and $x = \frac{c}{q}$

Substituting our coefficients

$$q = -\frac{1}{2} \left[t_1 t_2 + \sqrt{t_1^2 t_2^2 + 4r_1 r_2 T_c^2} \right]$$

With some algebra, this can be shown to be

$$q = -t_1 t_2 \left[1 + \frac{r_1 r_2 T_c^2}{t_1^2 t_2^2} + \cdots \right]$$

The only positive root is $x = -T_c/q$. Therefore

$$x = \frac{2T_c}{t_1t_2 + \sqrt{t_1^2t_2^2 + 4r_1r_2T_c^2}}$$

(Not very pretty, but straightforward enough.)

 \langle Find thickness when multiple internal reflections are present 259 \rangle \equiv

```
double B;
B = t1 * t2;
\mathbf{return} \ (-slab.cos\_angle * log(2 * Tc/(B + sqrt(B * B + 4 * Tc * Tc * r1 * r2))));
```

This code is used in section 255.

 $\S260$ IAD (v 3-13-1) ESTIMATING R AND T 115

260. Estimating R and T.

In several places, it is useful to know an *estimate* for the values of the reflection and transmission of the sample based on the measurements. This routine provides such an estimate, but it currently ignores anything corrections that might be made for the integrating spheres.

Good values are only really obtainable when $num_measures \equiv 3$, otherwise we need to make pretty strong assumptions about the reflection and transmission values. If $num_measures < 3$, then we will assume that no collimated light makes it all the way through the sample. The specular reflection is then just that for a semi-infinite sample and Tc = 0. If $num_measures \equiv 1$, then Td is also set to zero.

```

     (Calculate the unscattered transmission and reflection 262)
     (Estimate the backscattered reflection 263)
     (Estimate the scattered transmission 264)
This code is used in section 252.
```

262. If there are three measurements then the specular reflection can be calculated pretty well. If there are fewer then the unscattered transmission is assumed to be zero. This is not necessarily the case, but after all, this routine only makes estimates of the various reflection and transmission quantities.

If there are three measurements, the optical thickness of the sample is required. Of course if there are three measurements then the illumination must be collimated and we can call What_Is_B to find out the optical thickness. We pass this value to a routine in the fresnel.h unit and sit back and wait.

All the above is true if sphere corrections are not needed. Now, we just fob this off on another function.

 \langle Calculate the unscattered transmission and reflection 262 \rangle \equiv $Calculate_Minimum_MR(m,r,rc,tc);$

This code is used in section 261.

116 ESTIMATING R AND T IAD (v 3-13-1) $\S 263$

263. Finding the diffuse reflection is now just a matter of checking whether V1% contains the specular reflection from the sample or not and then just adding or subtracting the specular reflection as appropriate.

```
 \begin{array}{l} \langle \mbox{ Estimate the backscattered reflection } 263 \rangle \equiv \\ \mbox{ if } (m.fraction\_of\_rc\_in\_mr) \ \{ \\ *rt = m.m\_r; \\ *rd = *rt - m.fraction\_of\_rc\_in\_mr * (*rc); \\ \mbox{ if } (*rd < 0) \ \{ \\ *rd = 0; \\ *rc = *rt; \\ \} \\ \mbox{ } \\ \mbox{ else } \{ \\ *rd = m.m\_r; \\ *rt = *rd + *rc; \\ \} \\ \mbox{ if } (Debug(\mbox{DEBUG\_SEARCH})) \ \{ \\ fprintf(stderr, "\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$\sqcup$}\mbox{$}
```

This code is used in section 261.

This code is used in section 261.

264. The transmission values follow in much the same way as the diffuse reflection values — just subtract the specular transmission from the total transmission.

```
\langle Estimate the scattered transmission 264\rangle \equiv
   if (m.num\_measures \equiv 1) {
      *tt = 0.0;
      *td = 0.0;
   else if (m.fraction\_of\_tc\_in\_mt) {

```

- **265.** Transforming properties. Routines to convert optical properties to calculation space and back.
- **266.** a2acalc is used for the albedo transformations according to

$$a_{calc} = \frac{2a - 1}{a(1 - a)}$$

Care is taken to avoid division by zero. Why was this function chosen? Well mostly because it maps the region between $[0,1] \to (-\infty, +\infty)$.

```
 \begin{tabular}{ll} $\langle$ Prototype for $a2acalc$ & $266$ $\rangle$ $\equiv$ & $\mathbf{double}$ & $a2acalc$ & $(\mathbf{double}$ & $a)$ \\ This code is used in sections $253$ and $267$. \\ \end{tabular}
```

```
267. \langle Definition for a2acalc\ 267\rangle\equiv \langle Prototype for a2acalc\ 266\rangle {
    if (a\leq 0) return -BIG_A_VALUE;
    if (a\geq 1) return BIG_A_VALUE;
    return ((2*a-1)/a/(1-a));
}
```

This code is used in section 252.

268. acalc2a is used for the albedo transformations Now when we solve

$$a_c a l c = \frac{2a - 1}{a(1 - a)}$$

we obtain the quadratic equation

 $\langle \text{ Prototype for } acalc2a \text{ 268} \rangle \equiv$

$$a_{calc}a^2 + (2 - a_{calc})a - 1 = 0$$

The only root of this equation between zero and one is

$$a = \frac{-2 + a_{calc} + \sqrt{a_{calc}^2 + 4}}{2a_{calc}}$$

I suppose that I should spend the time to recast this using the more appropriate numerical solutions of the quadratic equation, but this worked and I will leave it as it is for now.

```
double acalc2a (double acalc)

This code is used in sections 253 and 269.

269. ⟨Definition for acalc2a 269⟩ ≡
⟨Prototype for acalc2a 268⟩
{

if (acalc ≡ BIG_A_VALUE) return 1.0;
else if (acalc ≡ -BIG_A_VALUE) return 0.0;
else if (fabs(acalc) < SMALL_A_VALUE) return 0.5;
else return ((-2 + acalc + sqrt(acalc * acalc + 4))/(2 * acalc));
}

This code is used in section 252.
```

270. g2gcalc is used for the anisotropy transformations according to

$$g_{calc} = \frac{g}{1 + |g|}$$

```
which maps (-1,1) \to (-\infty, +\infty).
\langle \text{ Prototype for } g2gcalc \ 270 \rangle \equiv
  double g2gcalc(double g)
This code is used in sections 253 and 271.
271. \langle \text{ Definition for } g2gcalc \ 271 \rangle \equiv
   \langle \text{ Prototype for } g2gcalc \ 270 \rangle
     if (g \le -1) return (-\texttt{HUGE\_VAL});
     if (g \ge 1) return (HUGE_VAL);
      return (g/(1-fabs(g)));
This code is used in section 252.
```

272. gcalc2g is used for the anisotropy transformations it is the inverse of g2gcalc. The relation is

$$g = \frac{g_{calc}}{1 + |g_{calc}|}$$

```
\langle \text{ Prototype for } gcalc2g | 272 \rangle \equiv
   double gcalc2g(double \ gcalc)
This code is used in sections 253 and 273.
273. \langle \text{ Definition for } gcalc2g \ \underline{273} \rangle \equiv
   \langle \text{ Prototype for } gcalc2g \ 272 \rangle
      if (gcalc \equiv -HUGE_VAL) return -1.0;
      if (gcalc \equiv HUGE\_VAL) return 1.0;
      return (gcalc/(1 + fabs(gcalc)));
This code is used in section 252.
```

b2bcalc is used for the optical depth transformations it is the inverse of bcalc2b. The relation is

$$b_{calc} = \ln(b)$$

The only caveats are to ensure that I don't take the logarithm of something big or non-positive.

```
\langle \text{ Prototype for } b2bcalc \text{ 274} \rangle \equiv
   double b2bcalc(\mathbf{double}\ b)
```

This code is used in sections 253 and 275.

```
275. \langle Definition for b2bcalc\ 275 \rangle \equiv \langle Prototype for b2bcalc\ 274 \rangle {

if (b \equiv \text{HUGE\_VAL})\ \text{return HUGE\_VAL};

if (b \le 0)\ \text{return}\ 0.0;

return (log(b));
}

This code is used in section 252.
```

276. bcalc2b is used for the anisotropy transformations it is the inverse of b2bcalc. The relation is

$$b = \exp(b_{calc})$$

The only tricky part is to ensure that I don't exponentiate something big and get an overflow error. In ANSI C the maximum value for x such that 10^x is in the range of representable finite floating point numbers (for doubles) is given by DBL_MAX_10_EXP. Thus if we want to know if

```
e^{b_{calc}} > 10^x
```

or

$$b_{calc} > x \ln(10) \approx 2.3x$$

```
and this is the criterion that I use.
```

```
\langle \text{ Prototype for } bcalc2b \ 276 \rangle \equiv
double bcalc2b(\mathbf{double} \ bcalc)
```

This code is used in sections 253 and 277.

```
277. \langle Definition for bcalc2b\ 277\rangle \equiv \langle Prototype for bcalc2b\ 276\rangle \{ if (bcalc \equiv \texttt{HUGE\_VAL})\ \textbf{return}\ \texttt{HUGE\_VAL}; if (bcalc > 2.3 * \texttt{DBL\_MAX\_10\_EXP})\ \textbf{return}\ \texttt{HUGE\_VAL}; \textbf{return}\ (exp(bcalc)); \} This code is used in section 252.
```

278. two prime converts the true albedo a, optical depth b to the reduced albedo ap and reduced optical depth bp that correspond to g = 0.

```
\langle \text{ Prototype for } twoprime | 278 \rangle \equiv
```

void $twoprime(\mathbf{double}\ a, \mathbf{double}\ b, \mathbf{double}\ g, \mathbf{double}\ *ap, \mathbf{double}\ *bp)$

This code is used in sections 253 and 279.

```
279. \langle Definition for twoprime\ 279\rangle \equiv \langle Prototype for twoprime\ 278\rangle {
    if (a \equiv 1 \land g \equiv 1) *ap = 0.0;    else *ap = (1-g)*a/(1-a*g);    if (b \equiv \mathtt{HUGE\_VAL}) *bp = \mathtt{HUGE\_VAL};    else *bp = (1-a*g)*b; }
```

This code is used in section 252.

This code is used in section 252.

280. two unprime converts the reduced albedo ap and reduced optical depth bp (for g=0) to the true albedo a and optical depth b for an anisotropy g.

```
 \begin{array}{l} \langle \operatorname{Prototype} \ \operatorname{for} \ twounprime \ \ 280 \rangle \equiv \\ \quad \operatorname{void} \ twounprime (\operatorname{double} \ ap, \operatorname{double} \ bp, \operatorname{double} \ g, \operatorname{double} \ *a, \operatorname{double} \ *b) \end{array}  This code is used in sections 253 and 281.  \begin{array}{l} \mathbf{281.} \quad \langle \operatorname{Definition} \ \operatorname{for} \ twounprime \ \ 281 \rangle \equiv \\ \langle \operatorname{Prototype} \ \operatorname{for} \ twounprime \ \ 280 \rangle \\ \{ \\ \quad *a = ap/(1-g+ap*g); \\ \quad \text{if} \ (bp \equiv \operatorname{HUGE\_VAL}) \ *b = \operatorname{HUGE\_VAL}; \\ \quad \text{else} \ *b = (1+ap*g/(1-g))*bp; \\ \} \end{array}  This code is used in section 252.
```

282. abgg2ab assume a, b, g, and g1 are given this does the similarity translation that you would expect it should by converting it to the reduced optical properties and then transforming back using the new value of g

```
\langle Prototype for abgg2ab\ 282\rangle \equiv void abgg2ab\ (double\ a1\ ,double\ b1\ ,double\ g1\ ,double\ g2\ ,double\ *a2\ ,double\ *b2) This code is used in sections 253 and 283.

283. \langle Definition for abgg2ab\ 283\rangle \equiv \langle Prototype for abgg2ab\ 282\rangle {
    double a,b;
    twoprime\ (a1\ ,b1\ ,g1\ ,\&a\ ,\&b);
    twounprime\ (a,b\ ,g2\ ,a2\ ,b2\ );
}
```

284. abgb2ag translates reduced optical properties to unreduced values assuming that the new optical thickness is given i.e., a1 and b1 are a' and b' for g=0. This routine then finds the appropriate anisotropy and albedo which correspond to an optical thickness b2.

If both b1 and b2 are zero then just assume g=0 for the unreduced values.

```
\langle Prototype for abgb2ag 284\rangle \equiv void abgb2ag (double a1, double b1, double b2, double *a2, double *g2) This code is used in sections 253 and 285.
```

```
285. \langle \text{Definition for } abgb2ag \ 285 \rangle \equiv \langle \text{Prototype for } abgb2ag \ 284 \rangle {

if (b1 \equiv 0 \lor b2 \equiv 0) {

*a2 = a1;

*g2 = 0;
}

if (b2 < b1) \ b2 = b1;

if (a1 \equiv 0) \ *a2 = 0.0;
else {

if (a1 \equiv 1) \ *a2 = 1.0;
else {

if (b1 \equiv 0 \lor b2 \equiv \text{HUGE\_VAL}) \ *a2 = a1;
else *a2 = 1 + b1/b2 * (a1 - 1);
}

if (*a2 \equiv 0 \lor b2 \equiv 0 \lor b2 \equiv \text{HUGE\_VAL}) \ *g2 = 0.5;
else *g2 = (1 - b1/b2)/(*a2);
}
```

This code is used in section 252.

 $\S312$ IAD (v 3-13-1) INDEX 129

312. Index. Here is a cross-reference table for the inverse adding-doubling program. All sections in which an identifier is used are listed with that identifier, except that reserved words are indexed only when they appear in format definitions, and the appearances of identifiers in section names are not indexed. Underlined entries correspond to where the identifier was declared. Error messages and a few other things like "ASCII code dependencies" are indexed here too.

136 NAMES OF THE SECTIONS IAD (v 3-13-1)

```
Allocate local simplex variables 213 Used in sections 212, 232, 237, 243, and 248.
 Calc M_R and M_T for dual beam sphere 178 \ Used in section 175.
 Calc M_R and M_T for no spheres 176 \rangle Used in section 175.
 Calc M_R and M_T for single beam sphere 177 \ Used in section 175.
 Calc M_R and M_T for two spheres 179 \ Used in section 175.
 Calculate and Print the Forward Calculation 6, 7, 8, 9 Used in section 2.
 Calculate and write optical properties 11, 35 \ Used in sections 2 and 31.
 Calculate specular reflection and transmission 256 \ Used in section 255.
 Calculate the deviation 180 V Used in section 175.
 Calculate the unscattered transmission and reflection 262 \ Used in section 261.
 Check MU 55 \ Used in section 52.
 Check MR for zero or one spheres 53 \ Used in section 52.
 Check MT for zero or one spheres 54 \rangle Used in section 52.
 Check for bad values of Tc 257 \ Used in section 255.
 Check sphere parameters 56, 57) Used in section 52.
 Choose the best node of the a and b simplex 217
                                                          Used in section 212.
 Choose the best node of the a and q simplex 235
                                                          Used in section 232.
 Choose the best node of the ba and q simplex 246
                                                           Used in section 243.
 Choose the best node of the bs and g simplex 251 \ Used in section 248.
 Choose the best node of the b and g simplex 241 \ Used in section 237.
 Clean up guesses 302 Used in section 292.
 Command-line changes to m 18 \rangle Used in section 2.
 Command-line changes to r 13 \rightarrow Used in sections 2 and 11.
 Count command-line measurements 19 \ Used in section 2.
 Declare variables for main 4, 33 Used in sections 2 and 31.
 Definition for Allocate\_Grid\ 138 \ Used in section 116.
 Definition for Calculate_Distance_With_Corrections 175
 Definition for Calculate_Distance 171 \rangle Used in section 116.
 Definition for Calculate_Grid_Distance 173 \rangle Used in section 116.
 Definition for Calculate\_MR\_MT 80 \ Used in section 43.
 Definition for Calculate\_Minimum\_MR 82 Used in section 43.
 Definition for Debug\ 307 \rangle Used in section 252.
 Definition for Estimate\_RT 261 \rightarrow Used in section 252.
 Definition for Fill\_AB\_Grid 155
                                      Used in section 116.
 Definition for Fill_-AG_-Grid\ 160 Used in section 116.
 Definition for Fill\_BG\_Grid 163 \ Used in section 116.
 Definition for Fill\_BaG\_Grid 165 \ Used in section 116.
 Definition for Fill\_BsG\_Grid 167 \ Used in section 116.
 Definition for Fill\_Grid\ 169 Used in section 116.
 Definition for Find\_AB\_fn 187 \ Used in section 116.
 Definition for Find\_AG\_fn 185 \ Used in section 116.
 Definition for Find\_A\_fn 193 \rightarrow Used in section 116.
 Definition for Find_{-}BG_{-}fn 199 \ Used in section 116.
 Definition for Find_{-}B_{-}fn 195 \ Used in section 116.
 Definition for Find\_BaG\_fn 201 \rightarrow Used in section 116.
 Definition for Find\_Ba\_fn 189 \ Used in section 116.
 Definition for Find\_BsG\_fn\ 203 \rightarrow Used in section 116.
 Definition for Find\_Bs\_fn 191 \rangle Used in section 116.
 Definition for Find_-G_-fn 197 \( \) Used in section 116.
 Definition for Gain_111123 Used in section 116.
 Definition for Gain_222 125 \ Used in section 116.
\langle \text{ Definition for } Gain \ 121 \rangle \quad \text{Used in section } 116.

138 NAMES OF THE SECTIONS IAD (v 3-13-1)

```
\langle \text{ Definition for } twoprime 279 \rangle Used in section 252.
 Definition for two unprime 281 Used in section 252.
 Estimate the backscattered reflection 263 \ Used in section 261.
Estimate the scattered transmission 264 \ Used in section 261.
 Estimate aprime 293 Used in section 292.
 Estimate bprime 294 Used in sections 296, 300, and 301.
 Evaluate the BaG simplex at the nodes 245 \rangle Used in section 243.
 Evaluate the BsG simplex at the nodes 250 \rangle Used in section 248.
 Evaluate the bg simplex at the nodes 240 Used in section 237.
 Evaluate the a and b simplex at the nodes 216 Used in section 212.
 Evaluate the a and g simplex at the nodes 234 Used in section 232.
 Exit with bad input data 48 Used in section 47.
 Fill r with reasonable values 64, 65, 66, 67 \rangle Used in section 63.
 Find the optical properties 49 Vsed in section 47.
 Find thickness when multiple internal reflections are present 259 \ Used in section 255.
 Free simplex data structures 219 \rightarrow Used in sections 212, 232, 237, 243, and 248.
 Generate next albedo using j 157, 158 \ Used in sections 155 and 160.
 Get the initial a, b, and q 214 \rightarrow Used in sections 212, 232, 237, 243, and 248.
 Guess when all three measurements are known 297 \ Used in section 292.
 Guess when finding albedo 298 \ Used in section 297.
 Guess when finding anisotropy and albedo 301 \ Used in section 297.
 Guess when finding optical depth 299 \rangle Used in section 297.
 Guess when finding the albedo and optical depth 300 \ Used in section 297.
 Guess when only reflection is known 295 \ Used in section 292.
 Guess when reflection and transmission are known 296 \ Used in section 292.
 Handle options 5) Used in section 2.
 Improve result using Monte Carlo 15 \ Used in section 11.
 Include files for main 3, 32 Used in sections 2 and 31.
 Initialize the nodes of the a and b simplex 215 \rangle Used in section 212.
Initialize the nodes of the a and g simplex 233 \rightarrow Used in section 232.
Initialize the nodes of the ba and q simplex 244 \ Used in section 243.
Initialize the nodes of the bs and g simplex 249 \quad Used in section 248.
 Initialize the nodes of the b and g simplex 239 Used in section 237.
 Iteratively solve for b 230 Used in section 229.
 Local Variables for Calculation 12 \rightarrow Used in section 11.
Nonworking code 156
 One parameter deviation 181 \ Used in section 180.
 One parameter search 60 Vsed in section 59.
 Print diagnostics 183 \ Used in section 175.
 Print results function 25 \ Used in section 2.
 Process the header 34 \ Used in section 31.
 Prototype for Allocate_Grid 137 \rangle Used in sections 117 and 138.
Prototype for Calculate_Distance_With_Corrections 174 \> Used in sections 117 and 175.
 Prototype for Calculate_Distance 170 \ Used in sections 117 and 171.
 Prototype for Calculate_Grid_Distance 172 \rightarrow Used in sections 117 and 173.
 Prototype for Calculate\_MR\_MT 79 \ Used in sections 44 and 80.
 Prototype for Calculate_Minimum_MR 81 \ Used in sections 44 and 82.
 Prototype for Debug\ 306 \rightarrow Used in sections 253 and 307.
Prototype for Estimate\_RT 260 Used in sections 253 and 261.
Prototype for Fill\_AB\_Grid\ 154 Used in sections 116 and 155.
Prototype for Fill_{-}AG_{-}Grid 159 \ Used in sections 116 and 160.
\langle \text{ Prototype for } Fill\_BG\_Grid \ 162 \rangle Used in sections 117 and 163.
```

```
\langle \text{ Prototype for } Fill\_BaG\_Grid \ 164 \rangle Used in sections 117 and 165.
Prototype for Fill_{-}BsG_{-}Grid 166 \rightarrow Used in sections 117 and 167.
Prototype for Fill\_Grid\ 168 \rightarrow Used in sections 117 and 169.
Prototype for Find\_AB\_fn 186 \ Used in sections 117 and 187.
Prototype for Find\_AG\_fn 184 \rangle Used in sections 117 and 185.
Prototype for Find_A fn 192 \ Used in sections 117 and 193.
 Prototype for Find_{-}BG_{-}fn 198 \ Used in sections 117 and 199.
 Prototype for Find_B_fn 194 \ Used in sections 117 and 195.
 Prototype for Find\_BaG\_fn\ 200 \rightarrow Used in sections 117 and 201.
Prototype for Find_Ba_fn 188 \ Used in sections 117 and 189.
Prototype for Find_BsG_fn = 202 Used in sections 117 and 203.
 Prototype for Find_Bs_fn 190 \ Used in sections 117 and 191.
Prototype for Find_{-}G_{-}fn 196 \rightarrow Used in sections 117 and 197.
 Prototype for Gain_11122 Used in sections 117 and 123.
 Prototype for Gain_{22} 124 \( \) Used in sections 117 and 125.
 Prototype for Gain 120 Used in sections 117 and 121.
Prototype for Get_Calc_State 133 \ Used in sections 117 and 134.
Prototype for Grid\_ABG 139 \ Used in sections 117 and 140.
Prototype for Initialize_Measure 70 \ Used in sections 44 and 71.
 Prototype for Initialize_Result 62 \rangle Used in sections 44 and 63.
 Prototype for Inverse\_RT 46 \rightarrow Used in sections 44 and 47.
 Prototype for Max_Light_Loss 206 \rightarrow Used in sections 117 and 207.
Prototype for MinMax\_MR\_MT 83 \ Used in sections 44 and 84.
Prototype for Near_Grid_Points 149 \ Used in sections 117 and 150.
 Prototype for Print_Invert_Type 308 \ Used in sections 253 and 309.
Prototype for Print_Measure_Type 310 \rangle Used in sections 253 and 311.
 Prototype for RT-Flip 151 \rangle Used in section 152.
 Prototype for Read_Data_Line 100 \ Used in sections 94 and 101.
 Prototype for Read_Header 96 \rightarrow Used in sections 94 and 97.
Prototype for Same\_Calc\_State \ 135\,\rangle Used in sections 117 and 136.
Prototype for Set_Calc_State 131 \ Used in sections 117 and 132.
 Prototype for Set_Debugging 304 \rangle Used in sections 253 and 305.
 Prototype for Spheres\_Inverse\_RT2 85 \ Used in sections 44, 45, and 86.
 Prototype for Spheres\_Inverse\_RT 72 \ Used in sections 45 and 73.
 Prototype for Two\_Sphere\_R 126 \rangle Used in sections 117 and 127.
 Prototype for Two\_Sphere\_T 128 \ Used in sections 117 and 129.
Prototype for U_Find_AB 211 \tag{11} Used in sections 210 and 212.
 Prototype for U_Find_AG 231 \times Used in sections 210 and 232.
Prototype for U_Find_A 224 \rightarrow Used in sections 210 and 225.
 Prototype for U_Find_BG 236 \rightarrow Used in sections 210 and 237.
 Prototype for U_Find_BaG 242 \rightarrow Used in sections 210 and 243.
 Prototype for U_Find_Ba 222 \ Used in sections 210 and 223.
Prototype for U_Find_BsG 247 \ Used in sections 210 and 248.
 Prototype for U_Find_Bs 220 \ Used in sections 210 and 221.
Prototype for U_Find_B = 228 Used in sections 210 and 229.
 Prototype for U_Find_G 226 Used in sections 210 and 227.
 Prototype for Valid_Grid 141 \rangle Used in sections 117 and 142.
 Prototype for What_{-}Is_{-}B 254 \rightarrow Used in sections 253 and 255.
Prototype for Write_Header 108 \rightarrow Used in sections 94 and 109.
Prototype for a2acalc\ 266 V used in sections 253 and 267.
Prototype for abg\_distance 147 Used in sections 117 and 148.
\langle \text{ Prototype for } abgb2ag \ 284 \rangle Used in sections 253 and 285.
```

```
\langle Prototype for abgg2ab 282\rangle Used in sections 253 and 283.
Prototype for acalc2a 268 \rangle Used in sections 253 and 269.
Prototype for b2bcalc 274\rangle Used in sections 253 and 275.
Prototype for bcalc2b 276 \rightarrow Used in sections 253 and 277.
Prototype for check_magic 106 \rightarrow Used in section 107.
Prototype for determine_search 58 \ Used in sections 44 and 59.
 Prototype for ez\_Inverse\_RT 68 \ Used in sections 44, 45, and 69.
 Prototype for q2qcalc 270 \ Used in sections 253 and 271.
 Prototype for gcalc2g 272 \rangle Used in sections 253 and 273.
Prototype for maxloss 204 Used in sections 117 and 205.
Prototype for measure\_OK 51 \ Used in sections 44 and 52.
Prototype for quick_quess 291 \rightarrow Used in sections 253 and 292.
Prototype for read\_number\ 104 \rightarrow Used in section 105.
 Prototype for skip\_white 102 \rightarrow Used in section 103.
Prototype for slow_guess 286 \ Used in section 287.
 Prototype for twoprime 278 Used in sections 253 and 279.
Prototype for two unprime 280 \ Used in sections 253 and 281.
Put final values in result 218 \(\rightarrow\) Used in sections 212, 221, 223, 225, 227, 229, 232, 237, 243, and 248.
 Read coefficients for reflection sphere 98 \ Used in section 97.
 Read coefficients for transmission sphere 99 \ Used in section 97.
 Slow guess for a alone 288 \rangle Used in section 287.
 Slow guess for a and b or a and g(290) Used in section 287.
Slow guess for b alone 289 \ Used in section 287.
Solve if multiple internal reflections are not present 258 \ Used in section 255.
Structs to export from IAD Types 40, 41, 42 \ Used in section 37.
Testing MC code 16
 Tests for invalid grid 143, 144, 145, 146 \ Used in section 142.
 Two parameter deviation 182 \ Used in section 180.
 Two parameter search 61 Vsed in section 59.
 Unused diffusion fragment 208
Write Header 14 \ Used in section 11.
Write first sphere info 113 \rangle Used in section 109.
 Write general sphere info 112 Used in section 109.
 Write irradiation info 111 \rangle Used in section 109.
 Write measure and inversion info 115 Used in section 109.
 Write second sphere info 114 \rangle Used in section 109.
Write slab info 110 \ Used in section 109.
 Zero GG 161 \rangle Used in sections 155, 160, 163, 165, and 167.
calculate coefficients function 22, 23 Used in section 2.
handle analysis 75 \ Used in section 73.
 handle measurement 76 \ Used in section 73.
handle reflection sphere 77 \rangle Used in section 73.
handle setup 74 Vsed in section 73.
handle transmission sphere 78 \ Used in section 73.
(handle2 analysis 91) Used in section 86.
handle2 illumination 88 \ Used in section 86.
handle2 measurement 92 \ Used in section 86.
handle2 reflection sphere 89 \ Used in section 86.
handle2 sample 87 \ Used in section 86.
(handle2 transmission sphere 90) Used in section 86.
